Humankind 2.0: The Technologies of the Future
6. Biotech

Piero Scaruffi, 2017

See http://www.scaruffi.com/singular/human20.html
for the full text of this discussion

A brief History of Biotech

1953: Discovery of the structure of the DNA

James Watson and Francis Crick Rosalind Franklin

A brief History of Biotech

1969: Jon Beckwith isolates a gene

1973: Stanley Cohen and Herbert Boyer create the first recombinant DNA organism

1974: Waclaw Szybalski coins the term "synthetic biology”

1974 Rudolf Jaenisch and Beatrice Mintz inject viral DNA into the DNA of early mouse embryos and produced the first transgenic mammals

1975: Paul Berg organizes the Asilomar conference on recombinant DNA

Asilomar, 1975

A brief History of Biotech

1976: Genentech is founded

1977: Fred Sanger invents a method for rapid DNA sequencing and publishes the first full DNA genome of a living being

Janet Rossant creates a chimera combining two mice species

1980: Genentech's IPO, first biotech IPO

A brief History of Biotech

1982: The first biotech drug, Humulin, is approved for sale (Eli Lilly + Genentech)

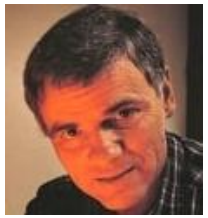
1983: Kary Mullis invents the polymerase chain reaction (PCR) for copying genes

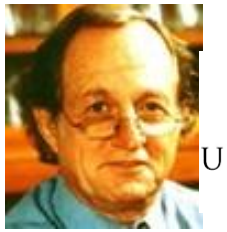
1986: Leroy Hood invents a way to automate gene sequencing

1986: Mario Capecchi performs gene editing on a mouse

1990: William French Anderson's gene therapy

1990: First baby born via PGD (Alan Handyside's lab)





THE UNIVERSITY OF UTAH

NATIONAL INSTITUTES OF HEALTH

UNIVERSITY OF LONDON

A brief History of Biotech

1989: AquAdvantage salmon by Memorial University in Newfoundland in Canada (approved for consumption in Canada in 2016)

1994: FlavrSavr Tomato

A brief History of Biotech

1994: Maria Jasin's homing endonucleases for genome editing

1996: Srinivasan Chandrasegaran's ZFN method for genome editing

1996: Ian Wilmut clones the first mammal, the sheep Dolly

1997: Dennis Lo detects fetal DNA in the mother's blood

2000: George Davey Smith introduces Mendelian randomization

Memorial Sloan Kettering Cancer Center

JOHNS HOPKINS BLOOMBERG SCHOOL of PUBLIC HEALTH

THE UNIVERSITY OF EDINBURGH

University of BRISTOL

A brief History of Biotech

1999 fluorescent fish GloFish by National University of Singapore

2000 Nexia Biotechnologies creates goats “augmented” with spider genes so that they produce milk equivalent to spider silk

A brief History of Biotech

2001: Dana Carroll's ZFN-based genome editing in cells

2002: Eckard Wimmer creates the first synthetic virus

2003: Dario Campana's method to make CAR-T cells

2003: The Human Genome Project is completed

A brief History of Biotech

2004: The first international conference on Synthetic Biology is held at the MIT

2005: Jay Keasling (UC Berkeley) artificially produces artemisinin acid

2005: Drew Endy's "Foundations for Engineering Biology"

syntheticbiology.org/Synthetic_Biology_1.0.html

Home | About | Conferences | Labs | Courses | Resources | FAQ

SB1.0 | Speakers | Schedule | Sponsors | Organizers | Topics | Videos

Synthetic Biology 1.0

The First International Meeting on Synthetic Biology

June 10-12, 2004
at the
Massachusetts Institute of Technology
Cambridge, MA

nature

Nature **438**, 449-453 (24 November 2005)

Foundations for engineering biology

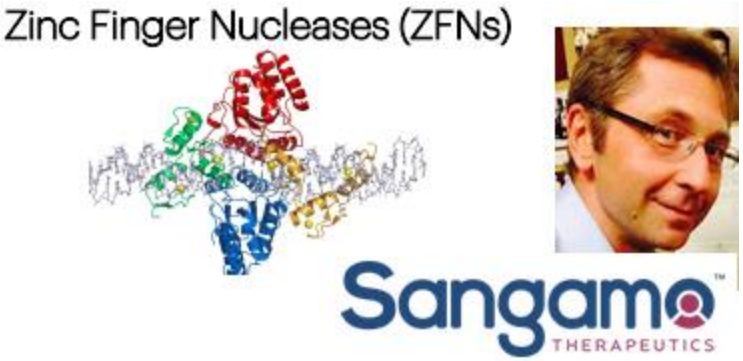
Drew Endy

A brief History of Biotech

2005: Fyodor Urnov uses ZFN to edit human DNA

2007: Personal genomics (Knome, 23andMe)

2007: Shinya Yamanaka converts adult human cells into pluripotent stem cells.



A brief History of Biotech

2008: The TALEN technique for genome editing (Dan Voytas, Feng Zhang)

2009: Jean Bennett's gene therapy restores vision in Corey Haas

2010: Craig Venter and Hamilton Smith (Maryland) reprogram a bacterium's DNA

2010: Cheap printers for living beings (OpenPCR, Cambrian Genomics)

2010: Carl June's CAR-T therapy

2011: The Voytas/Bogdanove TALEN kit

The Children's Hospital of Philadelphia®

A brief History of Biotech

2012: Markus Covert (Stanford) simulates an entire living organism in software

2012: Jennifer Doudna, Emmanuelle Charpentier and Feng Zhang develop the CRISPR-cas9 technique for genome editing

2013: Shoukhrat Mitalipov creates human embryonic stem cells from cloned embryos

2014: Weizhi Ji edits the germ-line of monkeys

2014: the first gene-therapy treatment approved in the West, Glybera by UniQure

uniQure
The leader in gene therapy

A brief History of Biotech

2014: Jef Boeke synthesizes a chromosome (in yeast)

2014: Floyd Romesberg expands life's genetic alphabet with two new bases

2015: Cellectis cures leukaemia in Layla Richards using TALENS editing

2015: Katsuhiko Hayashi's in vitro gametogenesis

2015: First Summit on Human Gene Editing

JOHNS HOPKINS UNIVERSITY

SCRIPPS

cellectis

九州大学
KYUSHU UNIVERSITY

First Summit on Human Gene Editing, 2015

A brief History of Biotech

2014 Valentino Gantz and Ethan Bier experiment gene drive on fruit flies

2015 Recombinetics uses TALEN to create two calves whose offspring should never have horns again

2015 Andrea Crisanti experiments gene drive on mosquitoes

A brief History of Biotech

2017: First gene therapy for cancer treatment approved in the USA

2017: Michele DeLuca combines stem-cell techniques with gene therapy to create artificial skin to cure a skin disease

UNIMORE

A brief History of Biotech

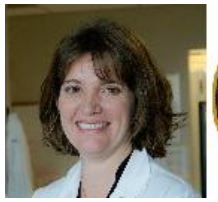
2017: Shoukhrat Mitalipov repairs a genetic mutation in human embryos that causes a heart disease

2018: Jiankui He uses CRISPR to modify human embryos and give birth to the first gene-edited babies

2018 Kimberly Cooper engineers the first gene drive in a mammal (in mice)

2019: Andrew Anzalone's & David Liu's prime editing

2019: CRISPR Therapeutics' gene-editing cure for sickle-cell disease CTX001



UNIVERSITY OF CALIFORNIA · SAN DIEGO

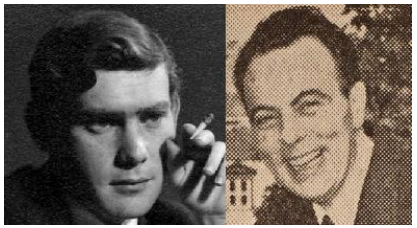
CRISPR THERAPEUTICS

A brief History of Biotech

mRNA medicine

1961: Sydney Brenner, Francois Jacob and Matthew Meselson determine the function of messenger RNA



AN UNSTABLE INTERMEDIATE CARRYING INFORMATION FROM GENES TO RIBOSOMES FOR PROTEIN SYNTHESIS

By DR. S. BRENNER

Medical Research Council Unit for Molecular Biology, Cavendish Laboratory, University of Cambridge

DR. F. JACOB

Institut Pasteur, Paris

AND

DR. M. MESELSON

Gates and Crellin Laboratories of Chemistry, California Institute of Technology, Pasadena, California

A brief History of Biotech

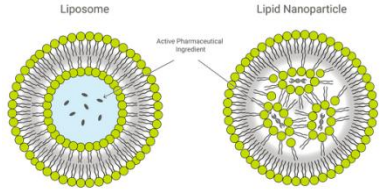
mRNA medicine

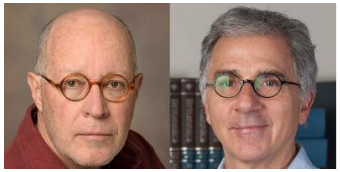
1965: Alec Bangham discovers liposomes

1984: Paul Krieg and Doug Melton synthesize mRNA in a lab

1987: Robert Malone discovers a method to deliver mRNA to human cells so that they begin producing proteins

1990: Katalin Kariko proposes using mRNA as an alternative to DNA-based gene therapy





A brief History of Biotech

mRNA medicine

1992: Gustav Jirikowski's first mRNA-based gene therapy on rats

1995: Robert Conry designs the first mRNA vaccine

1997: Eli Gilboa founds Merix Bioscience, the first mRNA therapeutics company

2005: Katalin Kariko' and Drew Weissman publish their research on how to make mRNA vaccines

Immunity, Vol. 23, 165–175, August, 2005, Copyright ©2005 by Elsevier Inc. DOI 10.1016/j.immuni.2005.06.008

Suppression of RNA Recognition by Toll-like Receptors: The Impact of Nucleoside Modification and the Evolutionary Origin of RNA

Katalin Karikó,[1,*] Michael Buckstein,[2] Houping Ni,[2] and Drew Weissman[2]
[1]Department of Neurosurgery
[2]Department of Medicine
University of Pennsylvania School of Medicine
Philadelphia, Pennsylvania 19104

thetic antiviral compound R-848 (Jurk et al., 2(a natural ligand has not been identified.

It has been known for decades that select and RNA molecules have the unique property vate the immune system. It was discovered cently that secretion of interferon in response is mediated by unmethylated CpG motifs acti

A brief History of Biotech

mRNA medicine

2008: Ugur Sahin and Ozlem Tureci found BioNTech

2010: Derrick Rossi (Harvard) discovers a method to make mRNA-based gene therapy and founds Moderna

mRNA-based therapeutics — developing a new class of drugs

Ugur Sahin[1,2], Katalin Karikó[2,3] and Özlem Türeci[1]

Highly efficient reprogramming to pluripotency and directed differentiation of human cells using synthetic modified mRNA

A brief History of Biotech

Trivia… Mutagenesis

1926: Hermann Muller demonstrates that exposure to x-rays caused genetic mutations in the genome of fruit flies

1920s: Lewis Stadler studies corn mutations caused by X-rays and ultraviolet rays

Radiation can speed up evolution

1949 "atomic garden" at Brookhaven National Laboratories in Rhode Island: vegetables exposed to radioactive isotopes like cobalt-60 and caesium-137

1950s: Vogue of "atomic" plants and seeds

Atomic gardens created 2,700 new varieties of plants, including most sweetcorn varieties

A brief History of Biotech

Trivia… Mutagenesis

Most of today's mint oil comes from a disease-resistance peppermint plant developed in 1971 at the Brookhaven National Laboratory

Radiation breeding is responsible for many of the gorgeous orchid, tulip and rose varieties

1958: Edward Knipling's "sterile insect" technique (sterilizing pupae with radiations)

A brief History of Biotech

Cloning

Dolly the Sheep, the first cloned mammal (July 1996 in Britain),

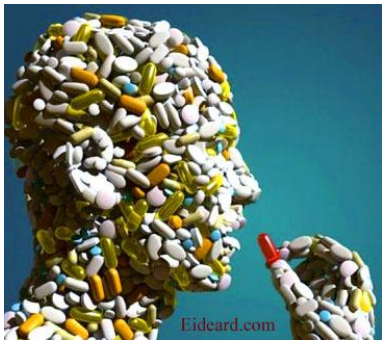
cloning of cattle in Wisconsin (just a few months later in 1997),

cloning cats (the Carbon Copy cat of 2001 in Texas)

cloning of horses (“Prometea” in 2003 in Italy)

cloning of dogs (“Snuppy” in 2005 in South Korea)

Big Pharma



- Big Pharma's revenues: $1.2 trillion (2016)

Big Pharma

- Europe: Novartis and Roche in Switzerland, GlaxoSmithKline and AstraZeneca in Britain, Bayer in Germany
- East Coast: Pfizer and Bristol-Myers Squibb in New York, and Merck, Johnson & Johnson, Wyeth, Sanofi and Organon in New Jersey, ThermoFisher in Boston
- Exceptions:Abbott (Chicago), Lilly (Indiana)
- California: none

1	Johnson & Johnson	9	Bayer
2	Novartis	10	Gilead Sciences
3	Roche	11	Teva
4	Pfizer	12	Amgen
5	Sanofi	13	AbbVie
6	Merck	14	Eli Lilly
7	GlaxoSmithKline	15	Bristol-Myers Squibb
8	AstraZeneca		

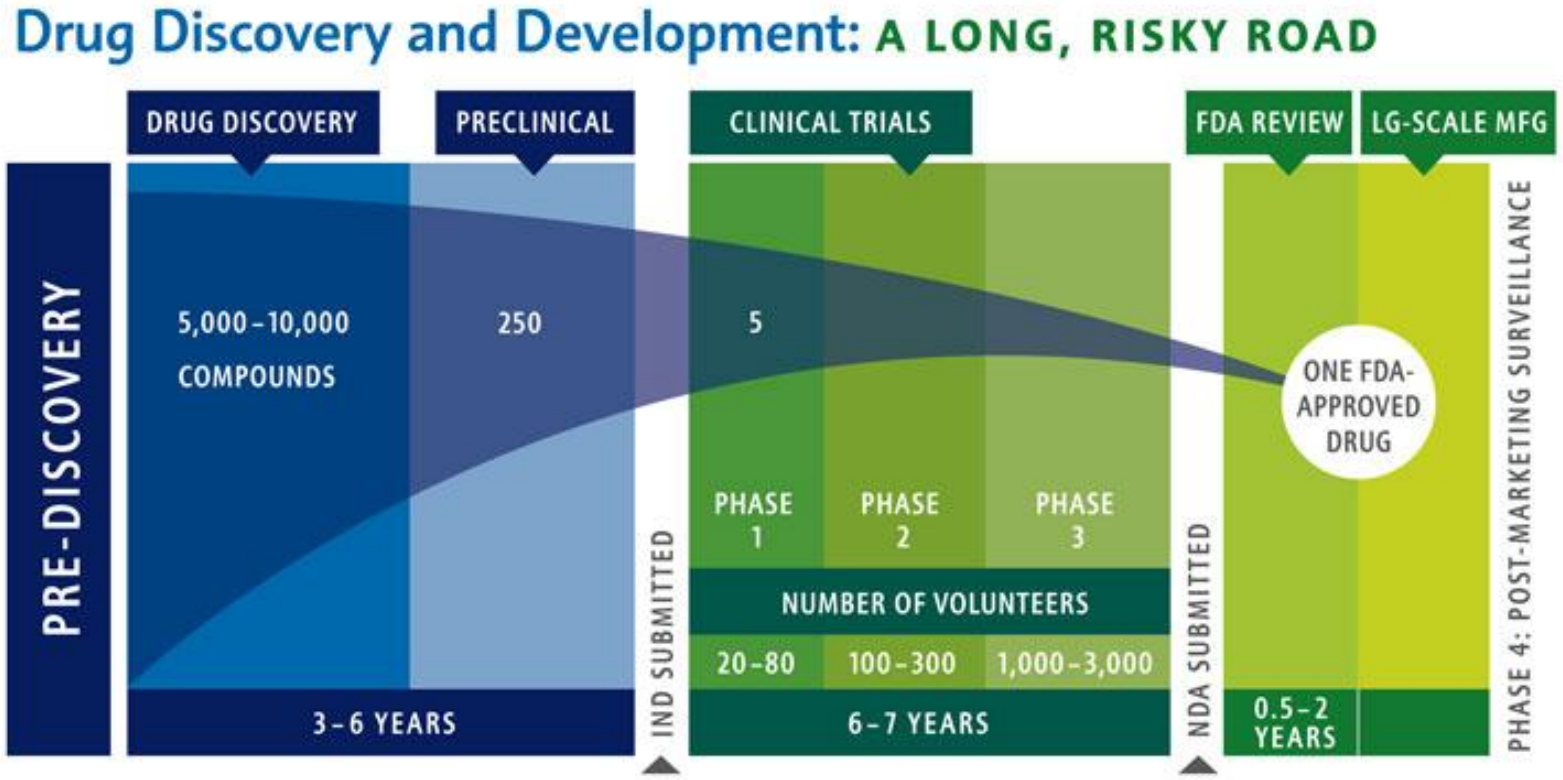
2015

Pharma vs Software

- A biotech startup needs much closer ties to the scientific community than software
- Biotech startups are typically founded by older people than software startups
- A biotech venture is a complex project that requires skills in chemistry, biology, engineering, marketing, and even skills in dealing with the government agency that approves drugs (the FDA) and with the big pharmaceutical companies (that have the power to sell a new drug worldwide).

Pharma vs Software

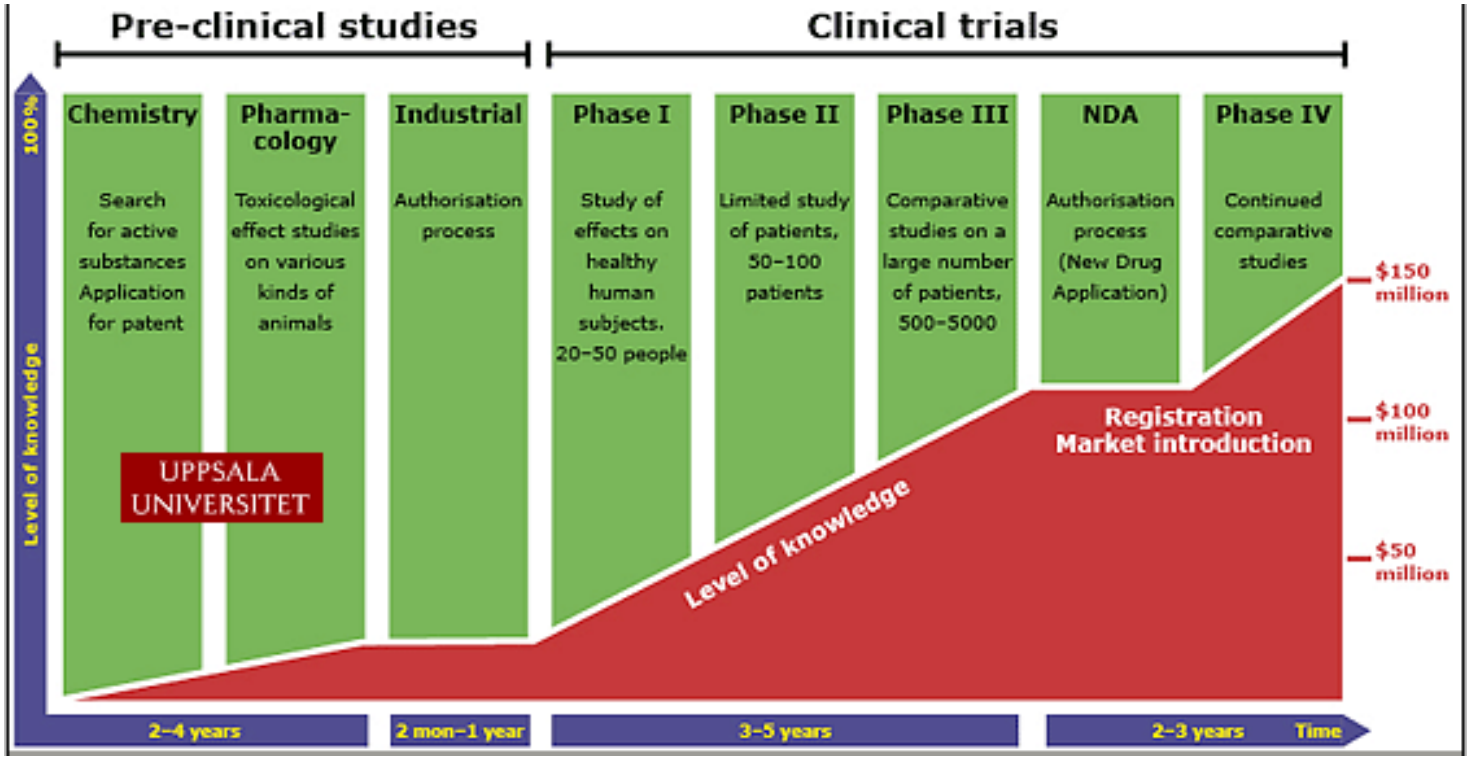
- The cost to develop a new drug is colossal compared with software.



Source: Pharmaceutical Research and Manufacturers of America

Pharma vs Software

- Just the clinical study can easily cost $10 million.
- Time to market: 5 to 10 years.

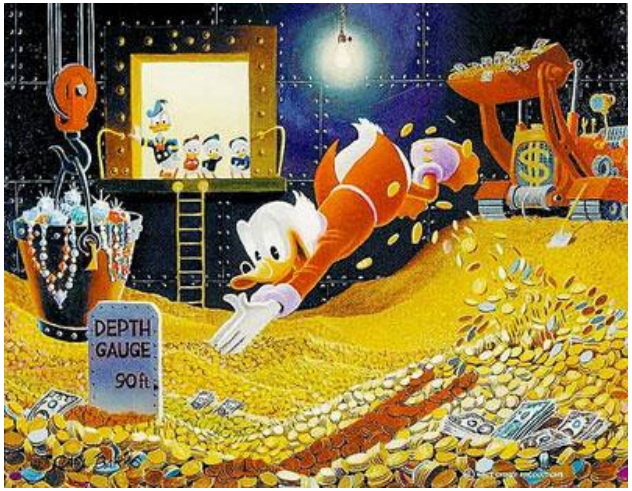


Pharma vs Software

- There are strict rules and regulations to obey that don't exist in software.
- Marketing a new drug is tougher than marketing a software application: drugs don't go viral the way a software app goes.
- Thousands of new software apps and gadgets are launched every year, but instead very few new drugs are approved every year by the FDA, usually less than 50.

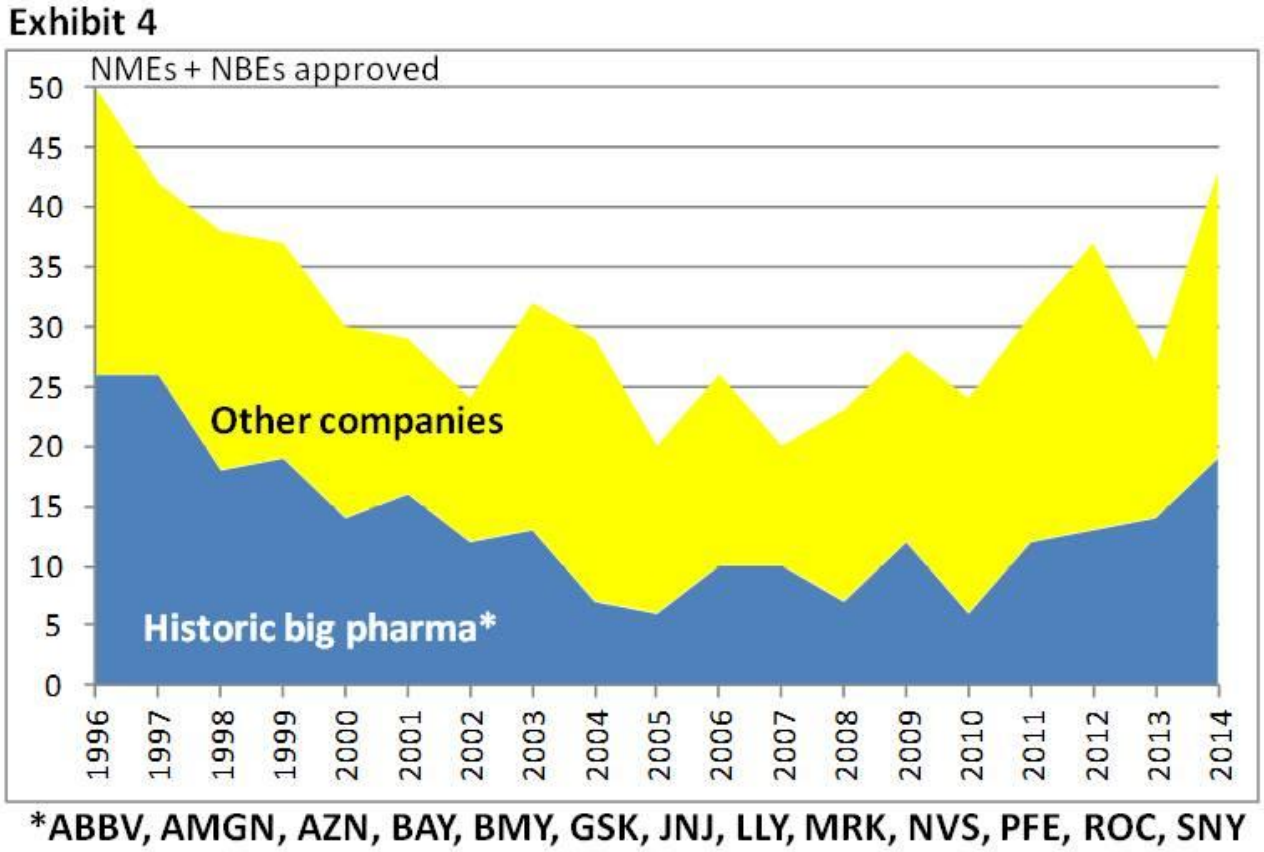
Pharma vs Software

- The risk for the biotech industry is much higher than the risk for the computer industry.
- But the payback can be astronomical…



FDA Approvals

- 1996: all-time record of approved drugs in the USA



FDA Approvals

- 2014
  - FDA approves 44 new drugs, an 18-year high
  - Biologicals: 16 (35%)
- 2015
  - FDA approves 51 new drugs, a 66-year high
  - Biologicals: 20 (39%)
- 2016
  - FDA approves only 22 (lowest number since 2010)
- 2017
  - FDA approves 46

FDA Approvals

- Ten-year trends:
  - Top three: J&J, GSK and Novartis (47 drugs)
  - "Big pharma" has averaged 42% of annual approvals

Company	Last 10 years 2006-2015	Last 5 years 2011-2015
Johnson & Johnson	17	9
GlaxoSmithKline	15	9
Novartis	15	9
Pfizer	11	7
Merck&Co	10	6
Roche	10	8
Bristol-Myers Squibb	9	6
Amgen	7	4
AstraZeneca	7	7
Boehringer-Ingelheim	7	6
Sanofi	7	5
Gilead	6	5
Takeda	6	5

FDA Approvals

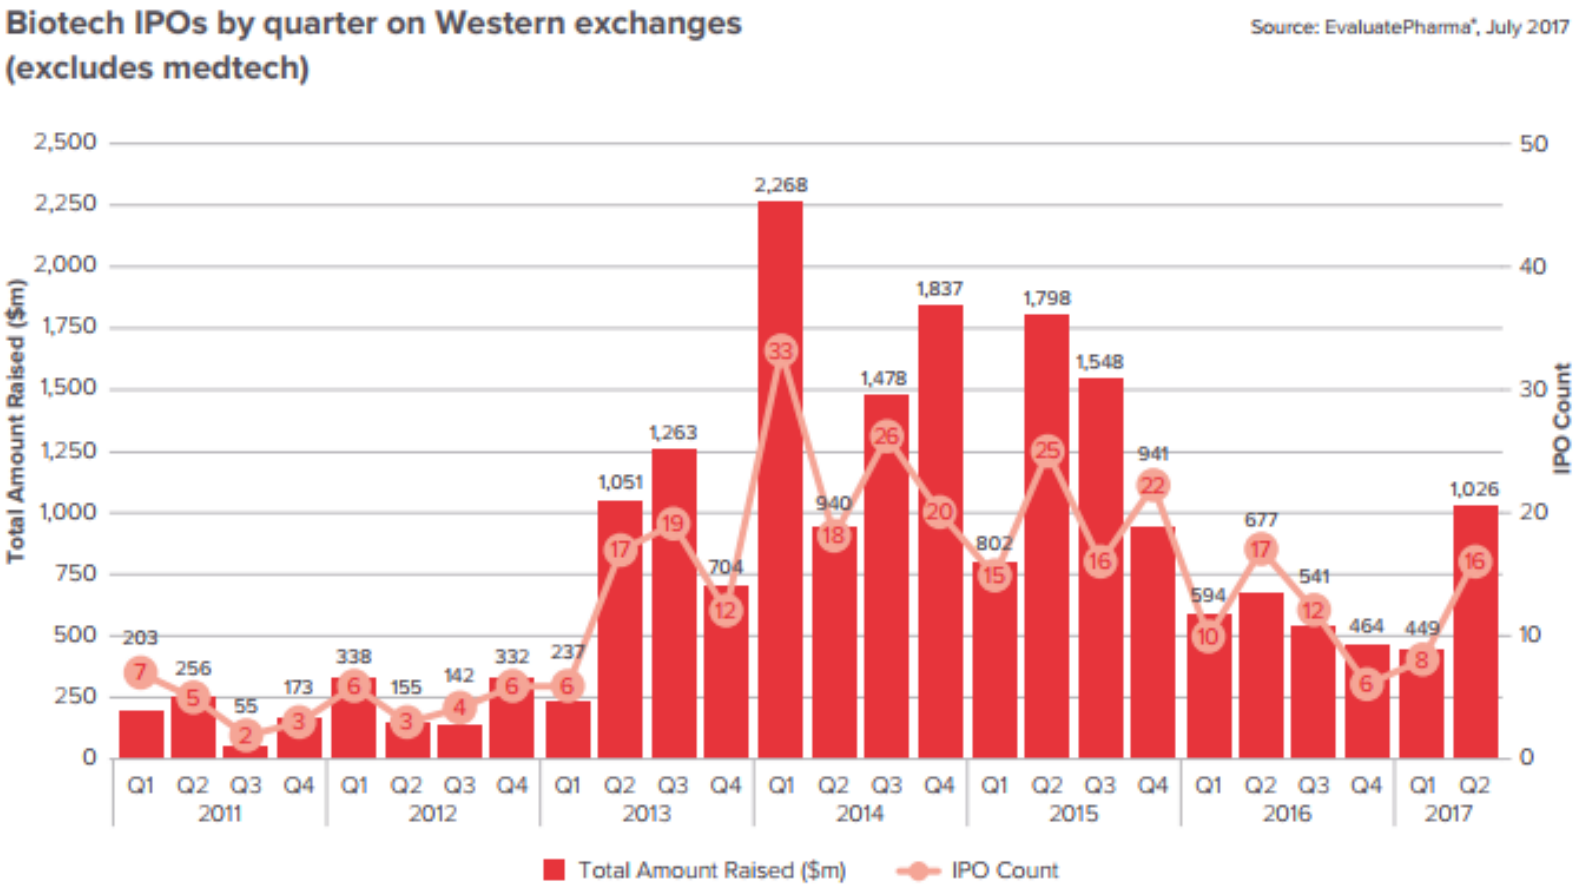
- Three-year trend:
  - Infectious diseases
  - Cancer
  - Rare diseases
  - Hematology
- Future trends (just guessing):

World Health Organization

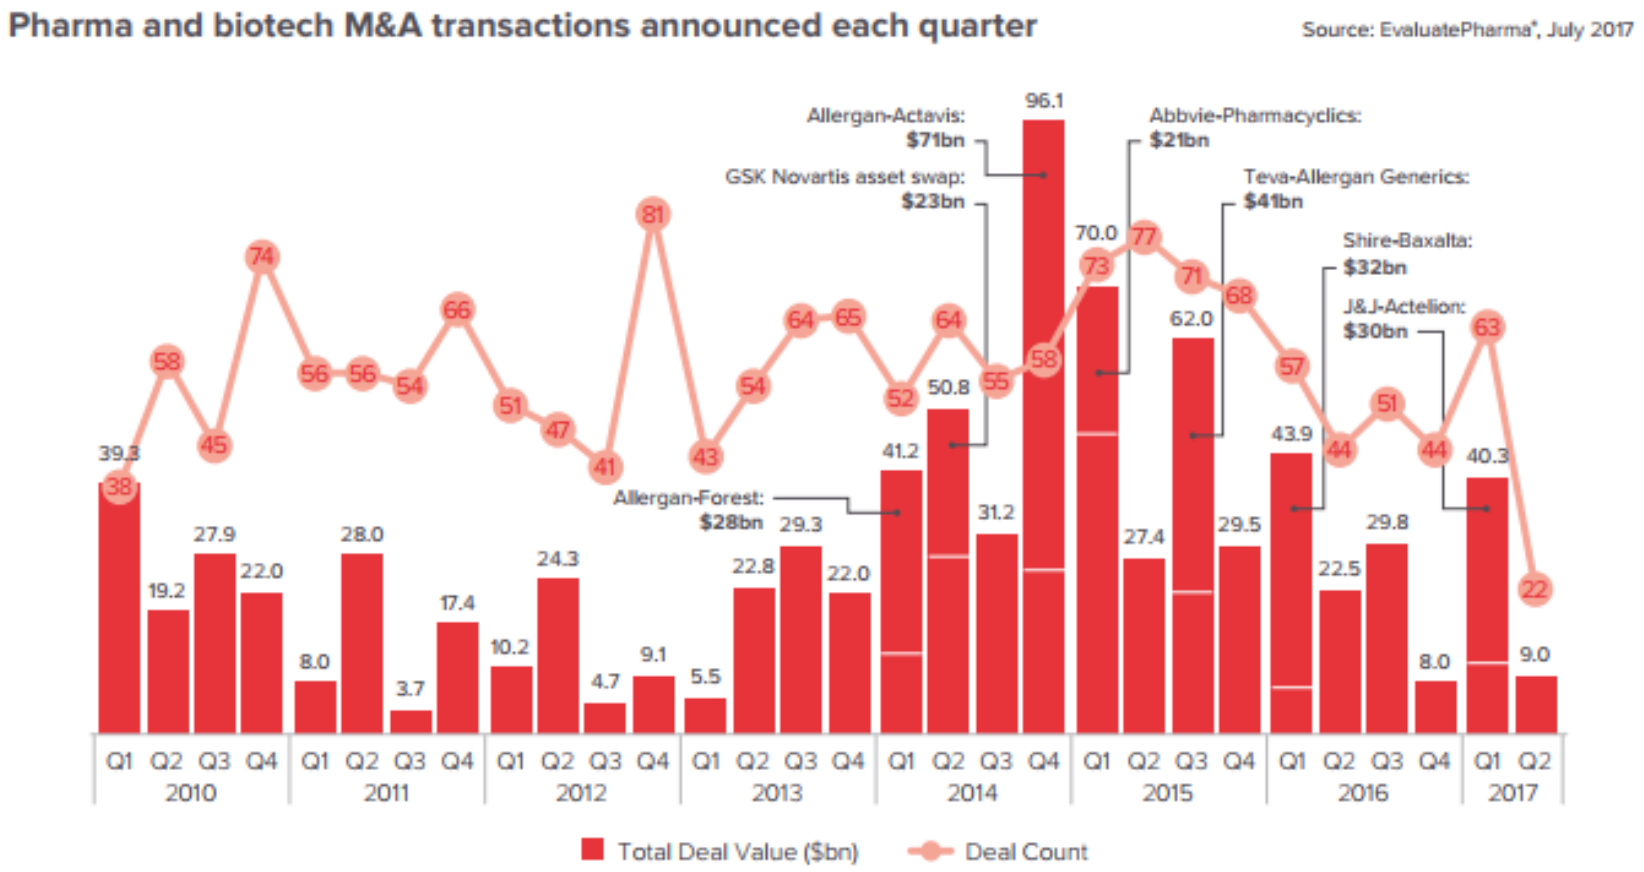
6 APRIL, 2016 | GENEVA - The number of people living with diabetes has almost quadrupled since 1980 to 422 million adults

In 2012, an estimated 1.5 million deaths were directly caused by diabetes

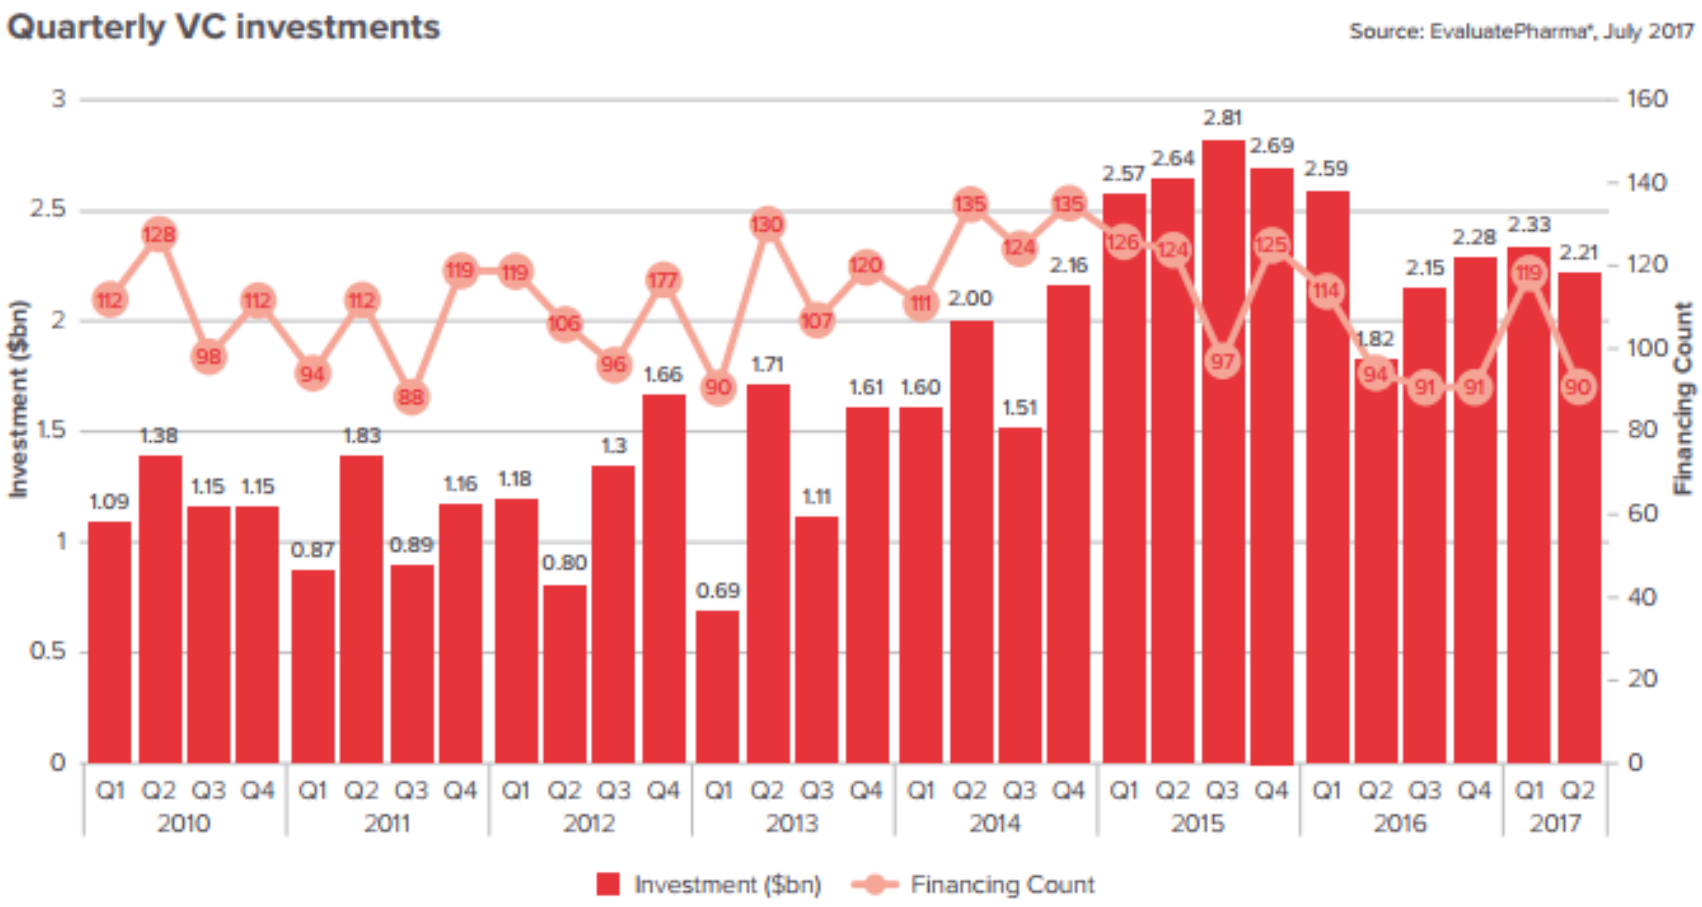
Biotech IPOs



Biotech Acquisitions



Biotech VC Investment



Biotech Case Studies

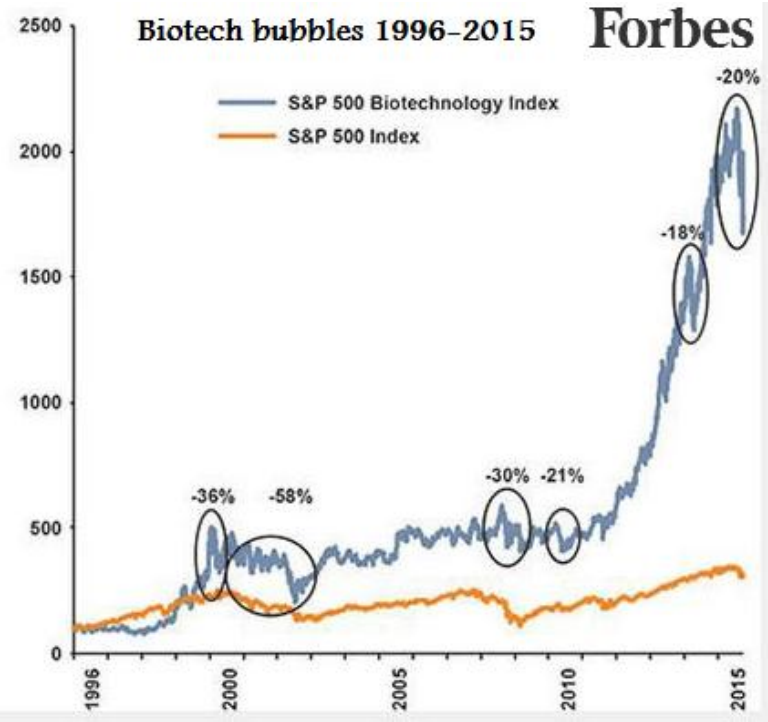
- Genentech (Bay Area, 1976)
  - 1980: Genentech's IPO, first biotech IPO
  - 1982: The first biotech drug, Humulin, is approved for sale
  - 1985: growth hormone Protropin
  - 1990: Roche deal, UCSF lawsuit, Hepatitis B vaccine
  - 1992 revenues: $544 million
- Amgen (Los Angeles, 1980)
  - 1989: Epogen to treat anemia
  - 1991: Neupogen to treat neutropenia
  - 1992: revenues pass $1 billion

Biotech Case Studies

- Gilead (Bay Area, 1987)
  - 1999: anti-flu Tamiflu
  - 2001: anti-AIDS Viread
  - 2013: anti-hepatitis C Sovaldi
  - 2015: largest biotech company, worth $150 billion
  - Fast FDA approval
  - Focus on fighting viruses (harder than fighting bacteria) to treat chronic and global diseases (AIDS, hepatitis C and the influenza).
- All of them founded by venture capitalists
- Time to market from incorporation to first major drug sales is 8-12 years

Biotech Bubbles

- The S&P 500 biotechnology index skyrocketed more than 400% between July 2010 and July 2015
- Q2 2015: $1.5 billion of venture capital into early-stage companies ($1B in the Bay Area alone)
- Second-longest bull market in biotech since 1992



Biotech Bubbles

Biomedicine

Theranos Promised a Revolution, but Delivered Dangerous Errors

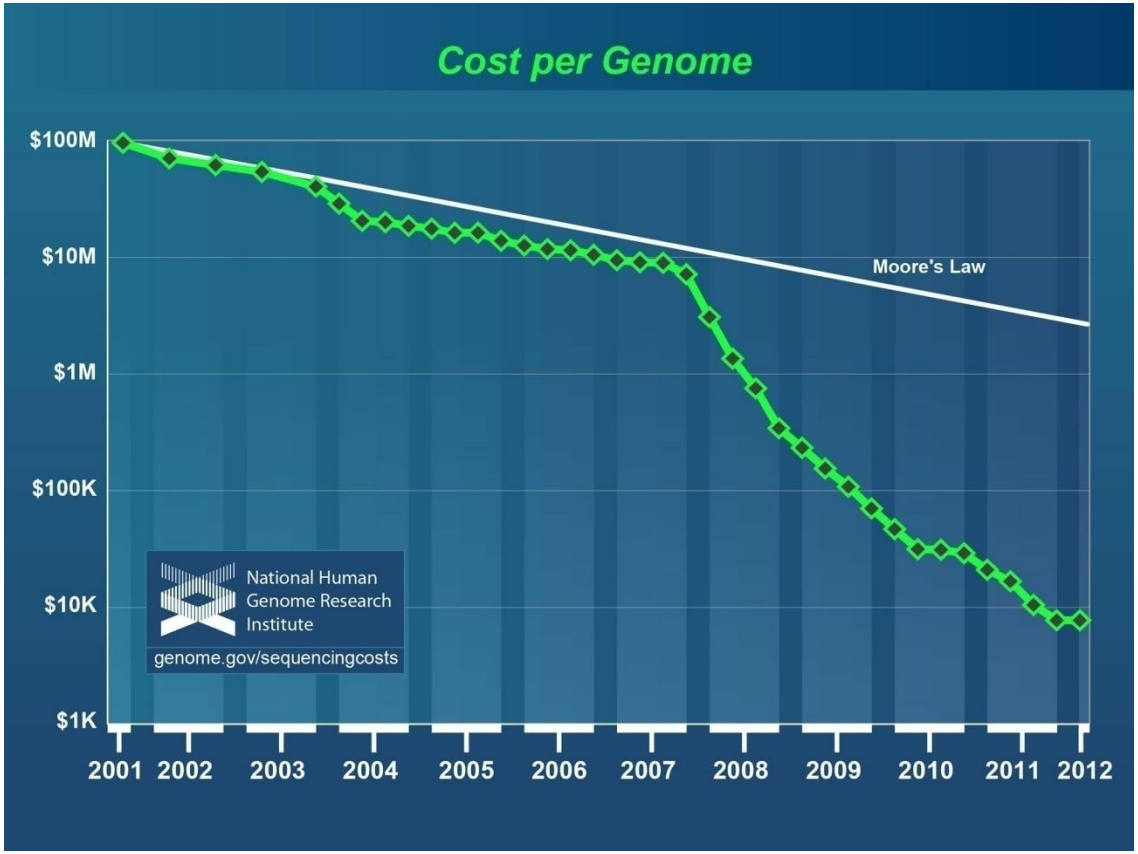
Forbes / Investing

SEP 9, 2015 @ 10:00 AM 201,827 VIEWS

The 30-Year-Old CEO Conjuring Drug Companies From Thin Air

Exponential Progress

- Moore's law vs Cost per genome
  - It took $3 billion and 13 years, from 1990 to 2003, to sequence the first human genome
  - It will soon cost $200, a drop of 99.9% since 2003



Biotech in the Bay Area

- The Bay Area has more biotech startups than the rest of the USA combined
- South San Francisco (birthplace of Genentech)
- Emeryville (near UC Berkeley)
- Mission Bay in San Francisco (UCSF medical campus)
- Silicon Valley

Biotech in the Bay Area

- Incubators
  - QB3 (California Institute for Quantitative Biosciences, 2000)
  - Berkeley Biolabs (2014)
  - Ireland's IndieBio (2014)
  - Johnson & Johnson's Jlab
  - Bayer's CoLaborator
  - Malaysia's BiotechCorp
  - …

Berkeley BioLabs

INDIE BIO

Personal Genomics

- Sequencing the entire human genome
  - Human Genome Project (2003): $3.7 billion
  - Knome (2007): $350,000
  - Veritas Genetics (2015): $1,000

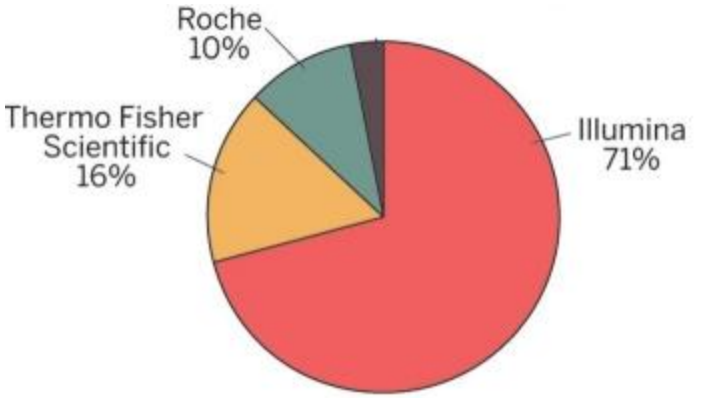
HGP's multinational team

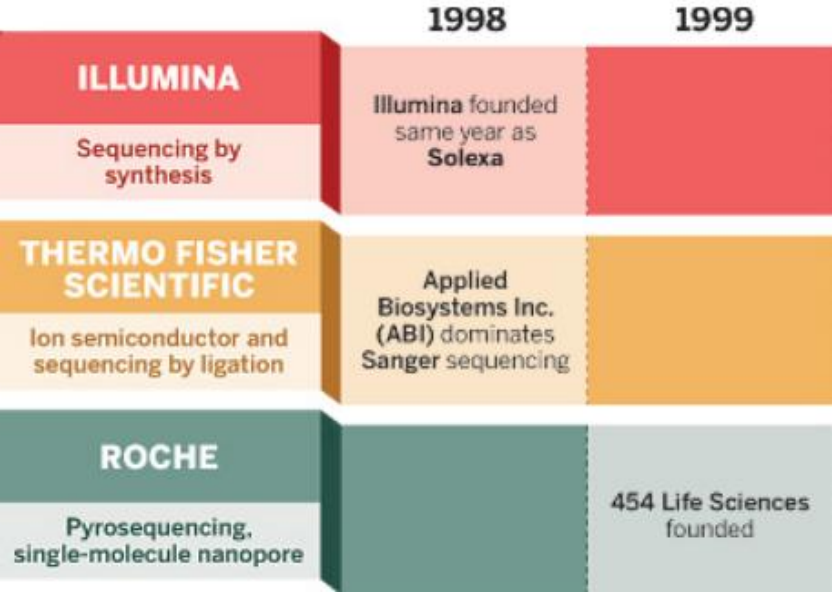
Personal Genomics

- Genome testing
  - 23andme (2006): $200 genome test (millionth customer in 2015)
  - Generations Network's AncestryDNA
  - National Geographic's Genographic Project
  - Family Tree DNA
- But no (actionable) health-related analyses

Personal Genomics

- Gene-sequencing machines
  - Illumina: $1,000 genome test (2015: 70% of the market for genome-sequencing, $1.6 billion revenues)
  - Applied Biosystems (Thermo Fisher Scientific)
  - 454 Corporation (Roche)





2014. Illumina's HiSeq X Ten sequencing costs less than $1,000

Personal Genomics

- Actionable genome testing
  - PierianDx/ Knome (St Louis, 2011): machines for medical labs to provide comprehensive, actionable reports
  - Sure Genomics (Las Vegas, 2014): Sequencing at home for $2,500
  - Veritas Genetics (Maryland, 2014): Sequencing + Interpretation for $1,000

Personal Genomics

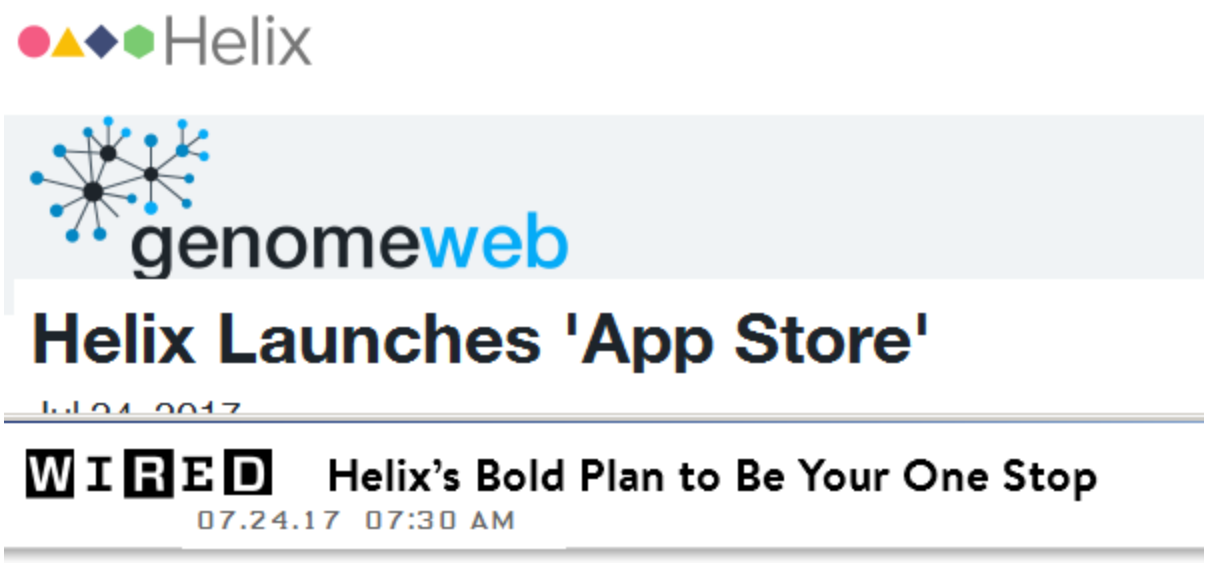
- Actionable genome testing
  - Veritas' MyGenome screens for 1,200 conditions and 100 inherited conditions
  - Inova's MediMap analyzes 31 genes that influence response to 145 prescription medications
  - Inova + Veritas Genetics (2017): MyMap for diet and lifestyle guidance

Personal Genomics

- Portable genome testing
  - Oxford Nanopore's Minion (2015)

Personal Genomics

- Platforms for genomic applications
  - Helix (Illumina spinoff, 2015): an “app store” for personal genomics



Longevity

1993: Cynthia Kenyon (UCSF): disabling Daf-2 gene

1999: Leonard Guarente (MIT) identifies the longevity gene in yeast, sir2

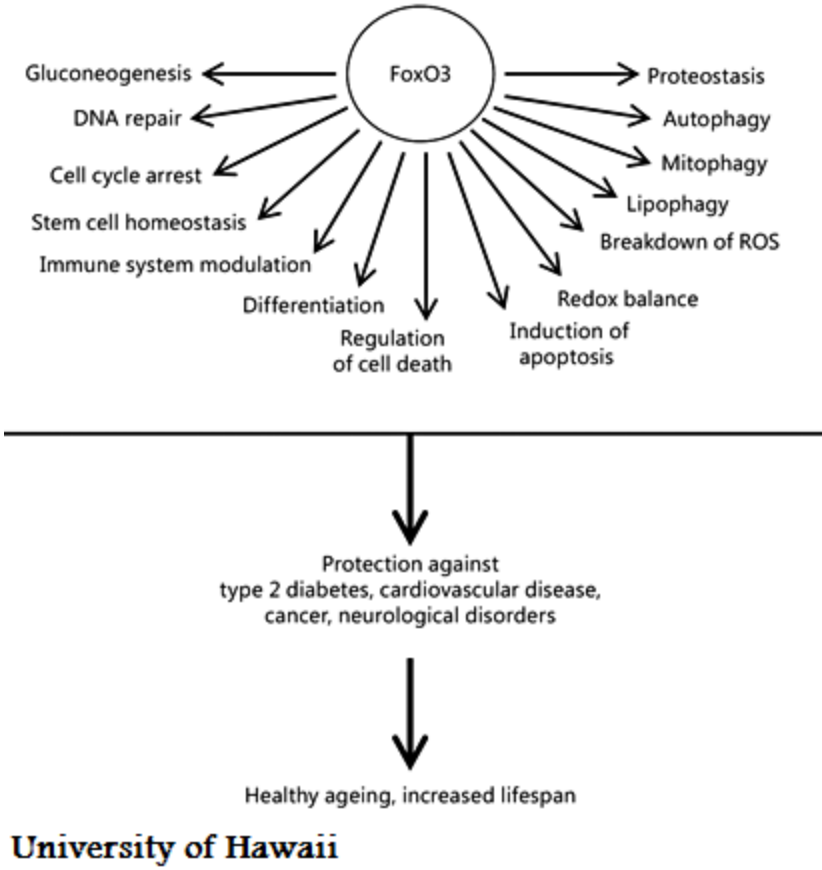
2010: Rochelle Buffenstein (Univ of Texas): NRF2 protects the body against aging

2012: the hydra is “immortal” due to the FoxO gene (Kiel Univ)

2016: Manfred Kayser (Erasmus Medical Centre): MC1R is responsible for looking older

Longevity

- 2008: The FoxO3 gene is very active in centenarians (Univ of Hawaii)
- 2012: the hydra is “immortal” due to the FoxO gene (Kiel Univ)



Longevity

- 1993: Cynthia Kenyon (UCSF): disabling Daf-2 gene can double the life of a worm; sugar shortens it (i.e. aging is not inevitable)
- 1996: Jim Woodget & Vuk Stambolic: Lithium inhibits GSK3
- 1999: Leonard Guarente (MIT) identifies the longevity gene in yeast, sir2
- 2003: Suppressing TOR prolongs the life of worms (Fritz Muller)

Cynthia Kenyon Finds That Mutations In Daf-2 And Daf-16 Genes Cause C. Elegans Worms To Live Over Twice As Long September 15, 1993

PUBLIC RELEASE: 3-NOV-2009

A 'spoonful of sugar' makes the worms' life span go down

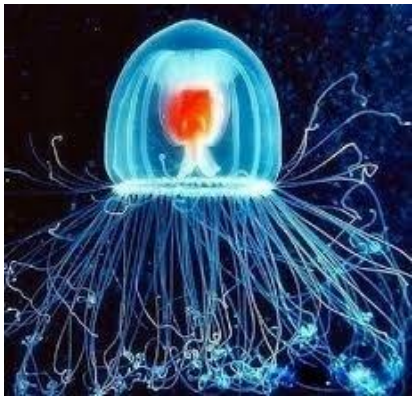
A REPORTER AT LARGE APRIL 3, 2017 ISSUE
SILICON VALLEY'S QUEST TO LIVE FOREVER
Can billions of dollars' worth of high-tech research succeed in making death optional?

The Science of Longevity

Rapid progress in A.I. + rapid progress in Biotech = A whole new discipline and industry, the discipline of Longevity



Why is hydra immortal?
Why the turritopsis can reverse its life cycle and rejuvinate?
Why did Jeanne Calment live to 122

Genomic Databases

- Another attack on privacy
  - Genomic companies collect the genomes of all their customers
  - Apps of the future: who has the "best“ genes for X (eg for longevity)?
  - Gold rush for "rare genes”
  - But we need your genome to make genomics useful (correlation between genes and health)

Genomic Databases

- Rare genes
  - Rare genetic mutations can help improve your genome

The Quest for Rare Genes

Amgen
The biotech in 2012 got genetic data on 160,000 Icelanders via its **$415 million** buyout of DeCode Genetics

Calico
The Google-backed company, searching for longevity genes, has partnered with Ancestry.com, which has collected millions of public family trees and more than **1 million genetic samples**

Regeneron
Working with Geisinger Health System to sequence genes of **100,000 volunteers**

23andMe
The genetic-testing pioneer has genotyped 1 million customers; it has deals with more than **10 drugmakers**, including Pfizer and Genentech

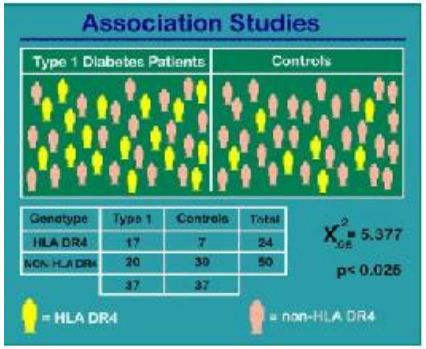
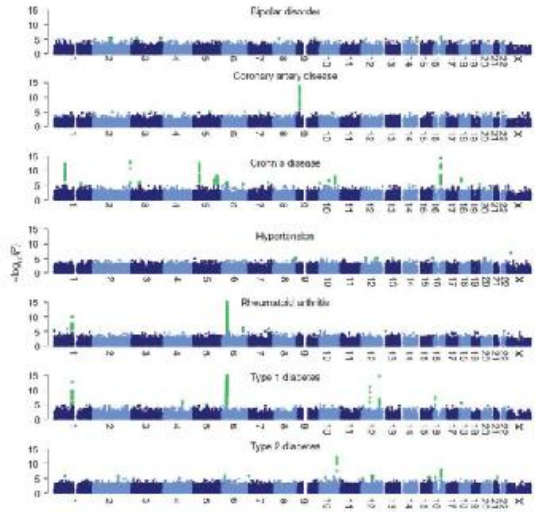
The dawn of genomic big data
Candidate gene studies using GWAS



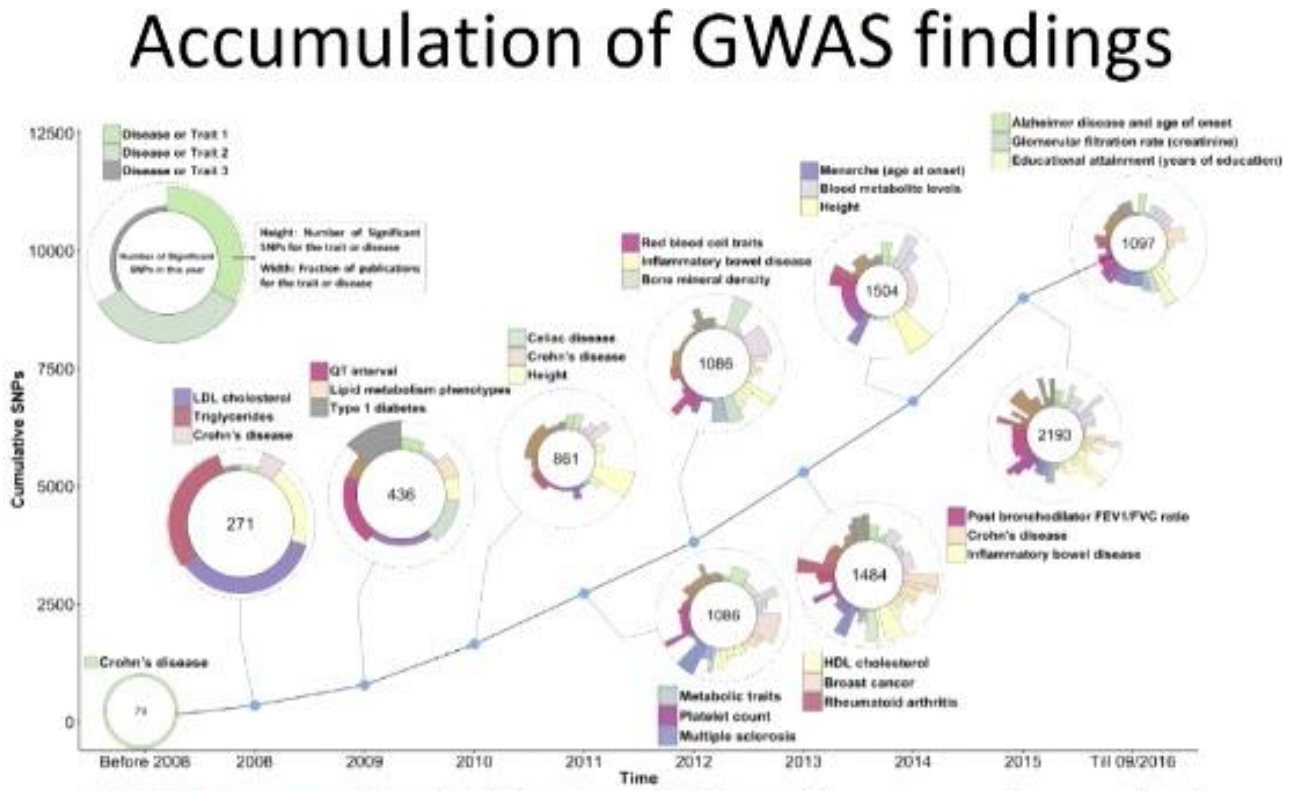
Odds Ratio: 3.6
95% CI = 1.3 to 10.4



The Wellcome Trust Case Control Consortium

Precision Medicine

- Discovery of gene-disease associations



Precision Medicine

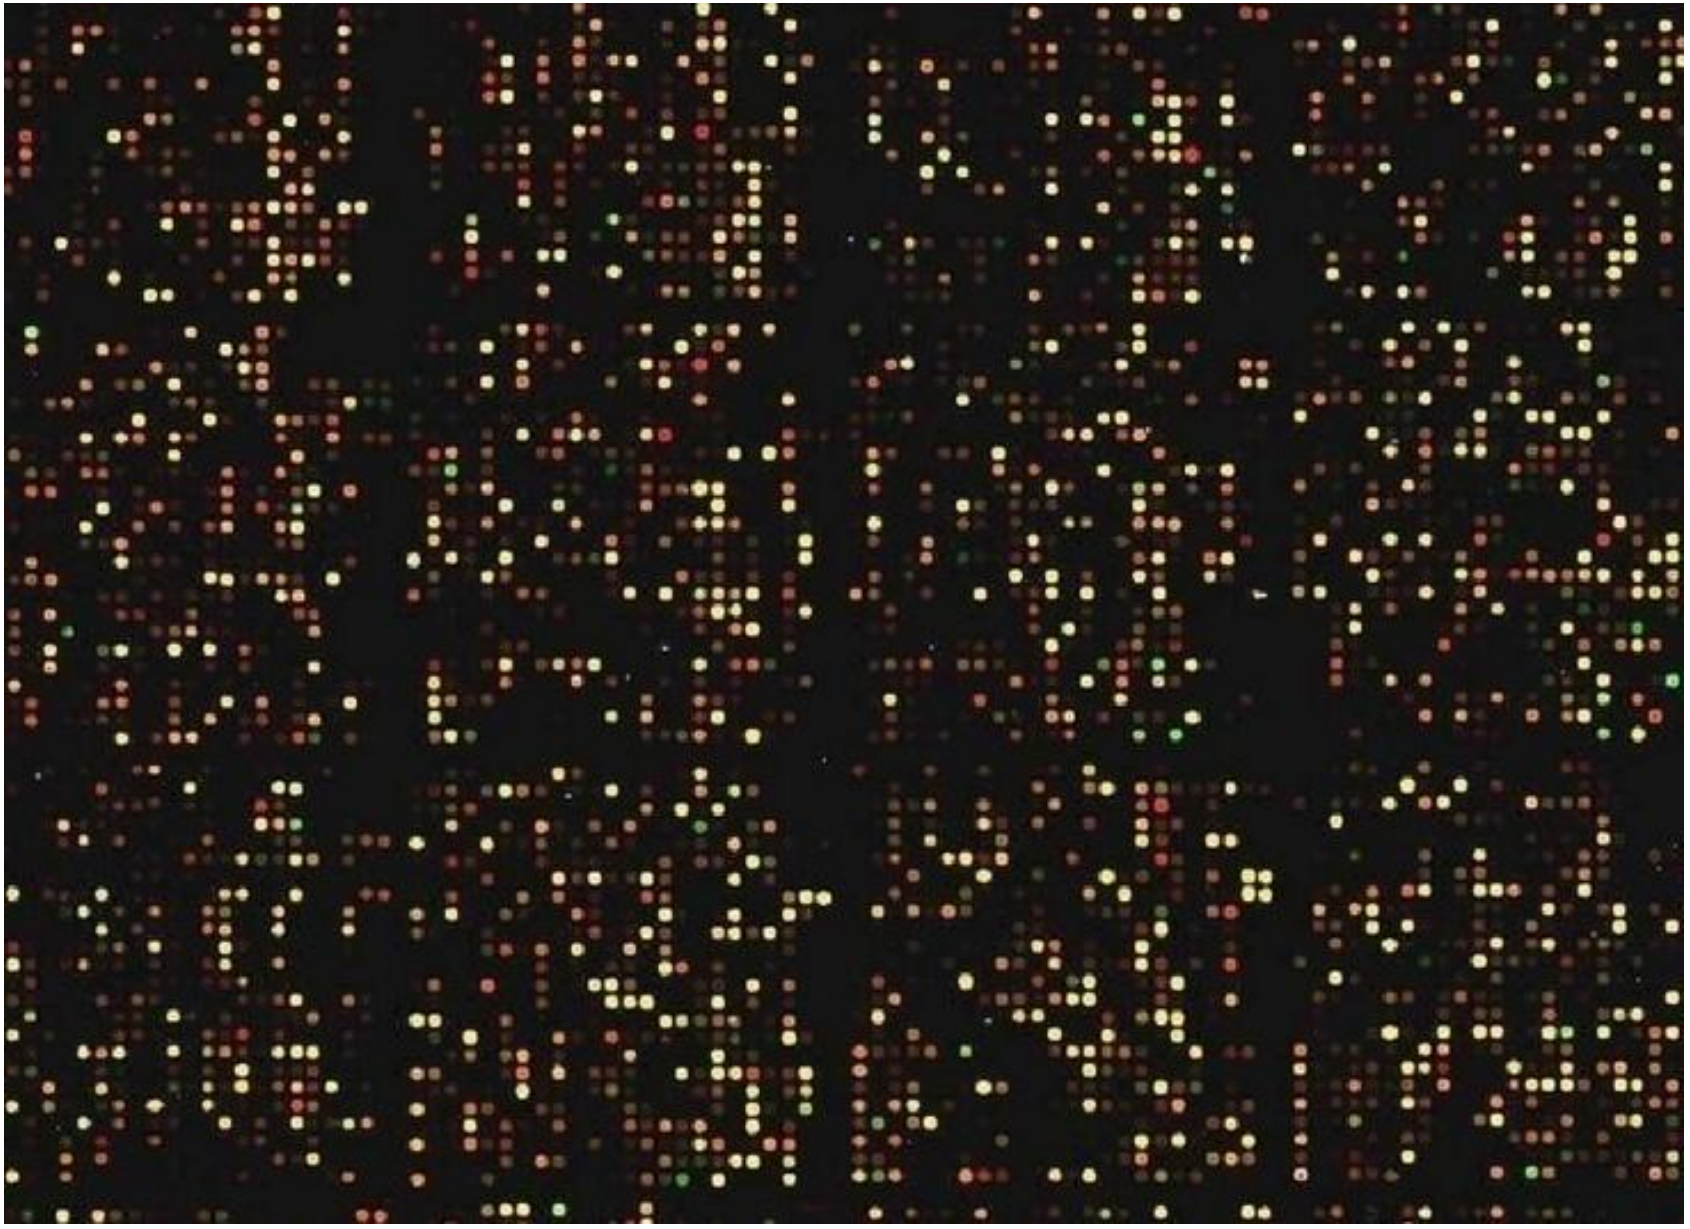
- Future trends

Future Trends

- Large population cohorts with comprehensive assessments of multiple clinical outcomes, intermediate phenotypes, biomarkers, lifestyle and environmental factors (e.g. UK Biobank)
- Large-scale whole-genome sequencing (e.g. UK 100,000K Project), enabling comprehensive assessment of rare variants
- Linking up genetic data with clinical databases and other data domains
- Greater integration of genetic data with functional annotation (e.g. eQTL, Roadmap Epigenome, ENCODE)
- Greater use of functional assays for evaluating the conse genetic mutations

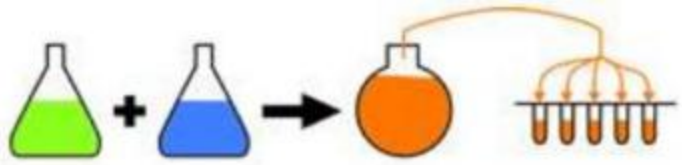
Pak Sham, Univ. of Hong Kong

Bio lab Automation

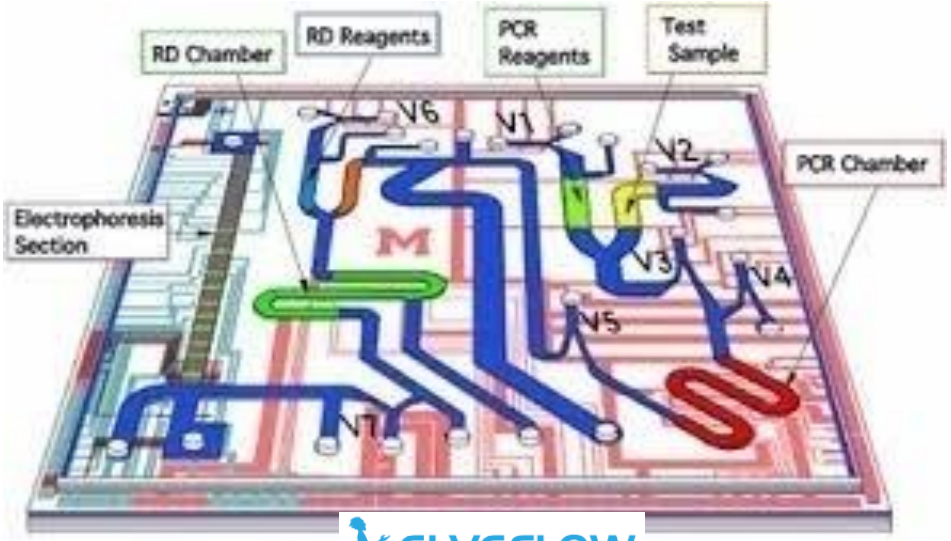


Bio lab Automation

- Many of the procedures involved in drug discovery are routine and repetitive
- Intensive information-processing techniques
- Lab-on-a-chips enable biotech startups to conduct analysis of thousands of DNA and protein samples per day



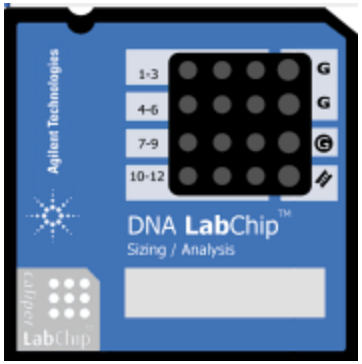
Traditional lab



Bio lab Automation

- 1964: Harvey Nathanson at Westinghouse makes the first MEMS (micro-electro-mechanical system)
- 1979: Stephen Terry at Stanford builds the first “lab-on-a-chip"
- 1983: Richard Feynman’s lecture "Infinitesimal Machinery“
- 1994: Affymetrix introduces the first "DNA chip" (or microarray)
- 1997: DARPA’s Microflumes program to fund research in microfluidics
- Microfluidics: the ability to make millions of microchannels
- 1999: Agilent introduces the first commercial "lab-on-a-chip" product

The first microarray



The first lab-on-a-chip

Bio lab Automation

- 2002: Wilhelm Ansorge at EMBL develops the amicroarray with the whole human genome
- 2004: First commercial microarrays of the whole human genome (Affymetrix, Agilent, Applied Biosystems, Illumina, NimbleGen)

affymetrix

Genome Editing

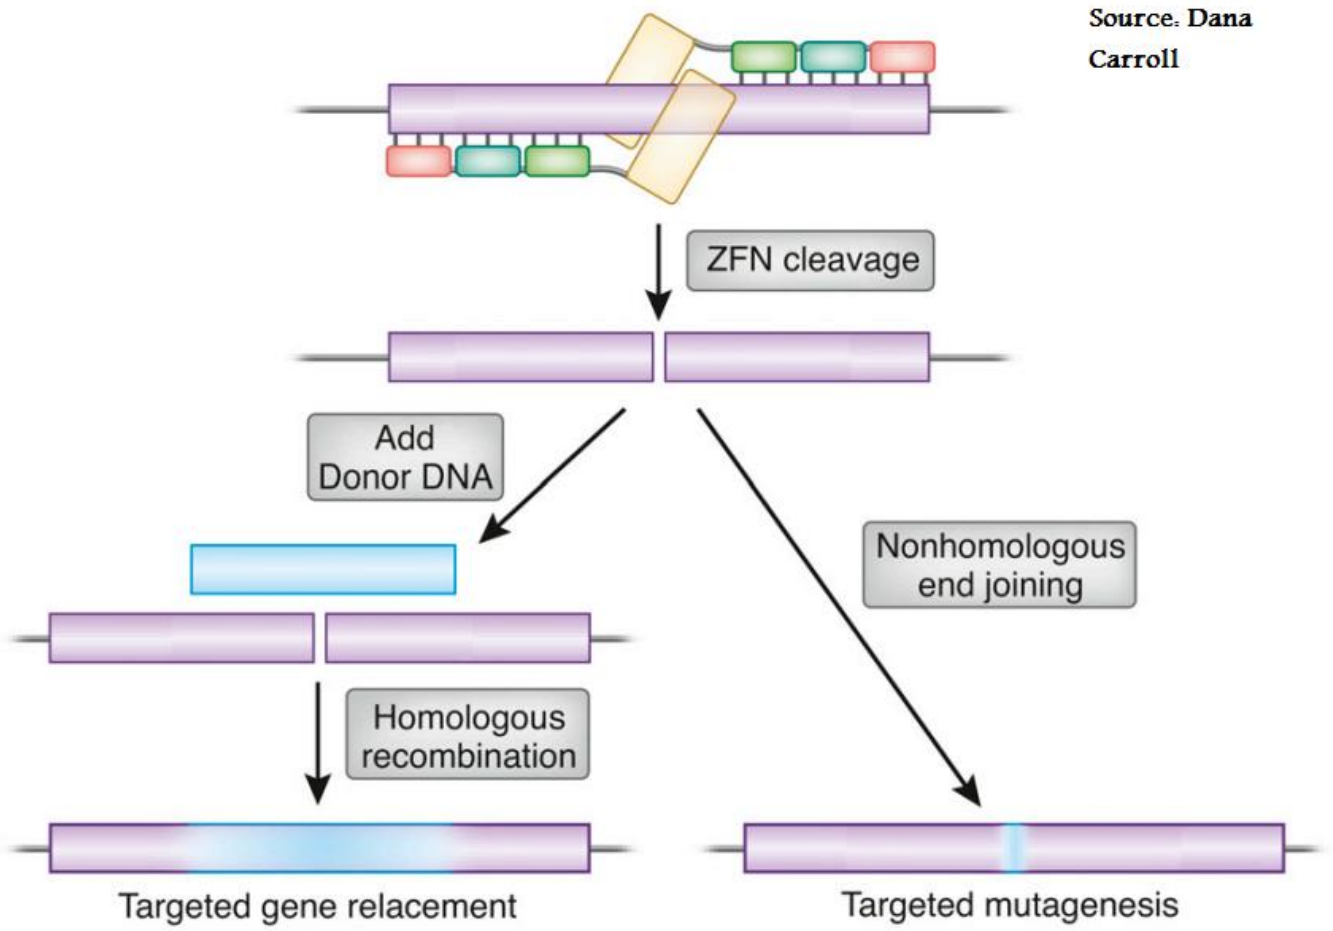
- The missing piece:
  - Lots of progress in reading genetic data (genome sequencing)
  - Lots of progress in writing genetic data (synthesis)
  - But still difficult to edit genetic data
    - The ZFN method, exclusively owned by Sangamo Biosciences

Zinc Finger Nucleases (ZFNs)

Sangamo™ THERAPEUTICS

Genome Editing

- ZFN



Genome Editing

- Why?
- Rare diseases
- Eugenetics

- There are an estimated 6,000~8,000 rare diseases. The rare diseases are estimated to collectively affect more than 200 million people worldwide;
- Three-quarters affect children, over half are life limiting;
- Over 80% of rare diseases are genetic in origin. Most are caused by defects in a single gene;
- Both the central nervous system (CNS), and peripheral organs and tissues are affected in most rare diseases;
- There are treatments for only 6% of rare diseases, of which fewer than 1% are curative;
- It was too expensive, at an average of $1 million per treatment.

Diaspora of CRISPR

The first CRISPR startups to go public:

- Charpentier, Novak, Foy, and Cowan: CRISPR Therapeutics
- Zhang, Church, and Doudna: Editas Medicine
- Sontheimer, Marraffini, Rossi, and Barrangou: Intellia Therapeutics

Trivia: Heroes of CRISPR

1993: Francisco Mojica (Spain)

2005: Alexander Bolotin (France)

2006: Eugene Koonin (NIH)

2007: Rodolphe Barrangou and Philippe Horvath (France)

2008: John van der Oost (Netherlands)

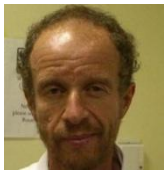
2008: Luciano Marraffini and Erik Sontheimer (Chicago)

2010: Sylvain Moineau (Canada)

2011: Virginijus Siksnys (Lithuania)

2012: Jennifer Doudna (UC Berkeley) and Emmanuelle Charpentier (Sweden)

2012: Feng Zhang (Boston) invenst the first CRISPR system to edit human cells



Trivia: Heroes of CRISPR

- Mojica, Horvath, Marraffini, Charpentier, Zhang...
- born outside the USA
- didn't work for major universities (Zhang was an independent researcher at MIT, not formally an MIT researcher)
- several of their papers were rejected by journals
- most of them were under 30 years old

A BRIEF HISTORY OF CRISPR

Key events in the CRISPR story.

December 1987
Researchers find CRISPR sequences in *Escherichia coli*, but do not characterize their function[8].

July 1995
CRISPR sequences are found to be common in other microbes[9].

March 2007
Scientists at food company Danisco determine that the repeats are part of a bacterial defence against viruses[10].

A cluster of biotech companies has sprung up to use CRISPR technology.

October 2011
CARIBOU BIOSCIENCES
Berkeley, California
Focus: Research, industry, therapeutics, agriculture
Raised: $11 MILLION

November 2013
EDITAS MEDICINE
Cambridge, Massachusetts
Focus: Therapeutics
Raised: $43 MILLION

November 2013
CRISPR THERAPEUTICS
Basel, Switzerland
Focus: Therapeutics
Raised: $89 MILLION

November 2014
INTELLIA THERAPEUTICS
Cambridge, MA
Focus: Therapeutics
Raised: $15 MILLION

June 2012
Researchers target CRISPR system to specific DNA sequences, highlighting its potential for genome editing[1].

January 2013
CRISPR is used in mouse and human cells, fuelling rapid uptake of the technique by researchers[11–13].

March 2013
The University of California and others file for a patent on the findings[1].

April 2014
MIT and the Broad Institute are granted a patent on CRISPR gene editing, sparking a fierce patent battle.

March 2015
Report of the first CRISPR gene drive, which can spread an edited gene rapidly through a population[6].

Source: Stanley Li

Genome Editing

- CRISPR Challenges
  - Standard Cas9 (SpCas9): derived from Streptococcus pyogenes
    - Alternatives: Cas9 orthologs from a different bacterium.
    - Millipore Sigma: FnCas9 (derived from Francisella novicida) and proximal CRISPR targeting (proxy-CRISPR)

Genome Editing

- CRISPR Challenges
  - Software Tools
    - Synthego: ICE (Inference of CRISPR Edits) for analyzing CRISPR experiments

Genome Editing

- CRISPR Challenges
  - RNA Engineering
    - RNA engineering is at a much earlier stage of development compared to DNA engineering
    - Patrick Hsu (Salk Inst): adapting CRISPR to editing RNA
    - DNA targeting is permanent, RNA targeting is potentially reversible

Genome Editing

- CRISPR Challenges
  - Expanding the palette:
    - New nuclease for genome editing: Cpf1 (eg prof Klinestiver)
    - Class 2 CRISPR-Cas systems: Cas9
    - Class 1 CRISPR-Cas systems are more challenging to introduce into eukaryotic cells

Genome Editing

- CRISPR Challenges
  - DETECTR (DNA endonuclease targeted CRISPR trans-reporter) platform (Jennifer Doudna's student Janice Chen) uses CRISPR-Cas12a to analyze cells, blood, saliva, urine, and stool, enabling the detection of genetic mutations, cancer, and antibiotic resistance, and diagnosis of bacterial and viral infections

Genome Editing

- CRISPR Challenges
  - CRISPR-Cas9 = Cas9 nuclease (for creating a DNA double-stranded break) + guide RNA (for targeting the nuclease to a specific region in the genome)
  - Cas9 nuclease: the enzyme that cuts the DNA
  - Selecting the right gRNA sequence is the first challenge facing CRISPR users
  - Fine-tuning gene expression: CRISPRa to activate a gene, CRISPRi to switch off a gene
  - CRISPRi and CRISPRa use deactivated or “dead” Cas9 (dCas9)

Genome Editing

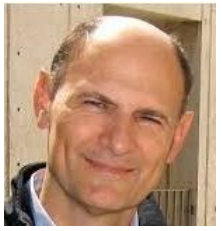
- CRISPR Challenges
  - Cellecta: single-guide RNA libraries for CRISPRi (inhibition) and CRISPRa (activation)
  - Horizon Discovery (formerly Dharmacon): synthetic gRNAs for CRISPRa (gRNAs targeting just one or two genes or whole classes of genes)

Genome Editing

- CRISPR challenges: genetic typos?

Genome Editing

- Applications of TALEN and CRISPR
  - Weizhi Ji at Kunming University in China uses CRISPR to edit the germ-line of monkeys (2014)
  - Chad Cowan and Derrick Rossi (Harvard, 2014): genetic engineering of human cells to make the immune system HIV-resistant
  - Daniel Anderson (MIT, 2014): genetic repair of a mutation that causes a disease
  - JuanCarlos Izpisúa-Belmonte (Salk Inst, 2015): remove HIV virus from cells



Genome Editing

- Applications of CRISPR
  - Xenotransplantation - Manufacturing transplantable organs (George Church's eGenesis in 2017)

egenesis

Opinion: Why 'Food 2.0' is tech's next big start-up craze

By Paul B. Farrell

Published: Oct 6, 2014 3:25 a.m. ET

MIT Technology Review

The Next Startup Craze: Food 2.0

by Ted Greenwald May 7, 2014

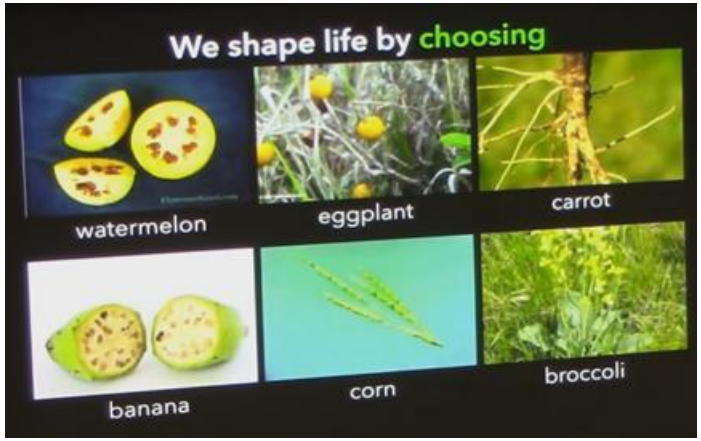
Silicon Valley investors and startups are trying to improve our food.

FOOD 2.0

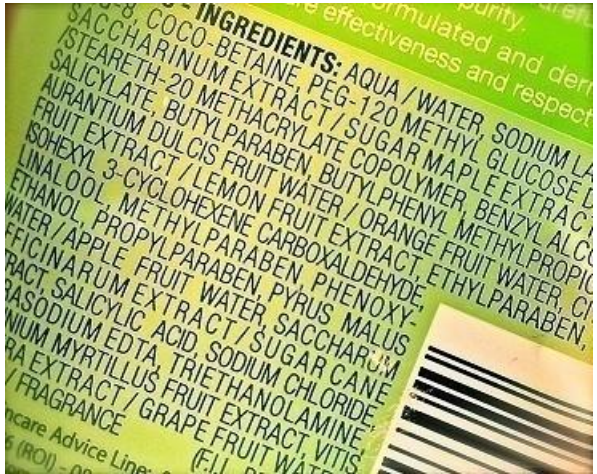
June 7 - 9, 2016 | Los Angeles, CA

Food 2.0

- In defense of GMOs:
  - Farmers have been "genetically engineering" plants and animals for centuries
  - Almost all the fruit that we eat today is genetically engineered
  - And what we eat and drink is hardly “natural”



original plants



Food 2.0

- In defense of GMOs:
  - Dogs are genetically engineered
  - Main difference between selective breeding and laboratory: the speed at which it happens
  - The plant created inside the laboratory is actually more "scientific" than the plant created by the farmer

Food 2.0

- In defense of GMOs:
  - No transgenic crop has been found dangerous for humans.
  - TALEN and CRISPR techniques can modify a plant without the addition of foreign genes
  - Caixia Gao (China, 2014): genetic engineering of wheat, tomatoes, soybeans, rice, potatoes…

Food 2.0

- Why we need GMOs:
  - To adapt our crops and fruit to the rapid fluctuations of climate
  - Extreme weather will become a common occurrence
  - We cannot afford to wait 10-20 years to improve our plants
  - David Lobell (Stanford) & Wolfram Schlenker (Columbia): *"Climate Trends and Global Crop Production Since 1980"* (2011)

Food 2.0

- Why we need GMOs:
  - Rice feeds 40% of the world's population
  - Paul Quick (Univ of Sheffield) at the International Rice Research Institute (IRRI)
  - C4 Rice Project (2009), funded by the Bill & Melinda Gates Foundation

DL in Bioinformatics

- The authors founded Deep Genomics (2015)…
- … it helps to have good neighbors

DL in Bioinformatics

- Gene expression regulation
  - Problem: NIH's Library of Integrated Network-Based Cellulanatures or LINCS: to save costs, profile the expression of only ~1000 landmark genes from the Connectivity Map (CMap) project and inferring the expression of remaining target genes (whose gene expression is correlated to the landmark genes) via linear regression. This way the LINCS program has generated ~1.3 million gene expression profiles, but LR ignores the nonlinearity within gene expression profiles.

Drug Discovery

According to the Tufts Center for the Study of Drug Development, it takes an average of 12 years and about $2.6 billion to put a new drug on the market.

Drug Discovery

Automating and accelerating the process of drug discovery

Drug Discovery

Rein Vos' *"The Enigma of Drug Discovery"* shows that the process of drug discovery can be modeled, and therefore automated

Can it be accelerated?

Can we design better molecules, enzymes, peptides to cure diseases?

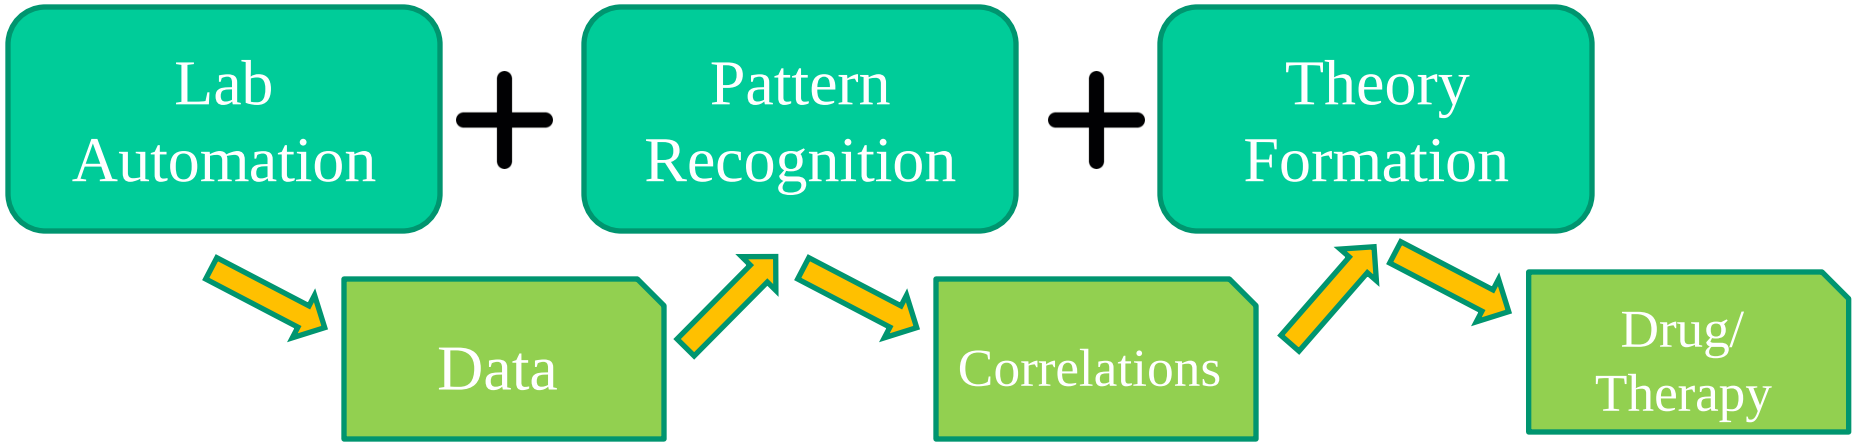
OXFORD GLOBAL

Artificial Intelligence in Drug Development Congress

27-28 September 2017, London, UK

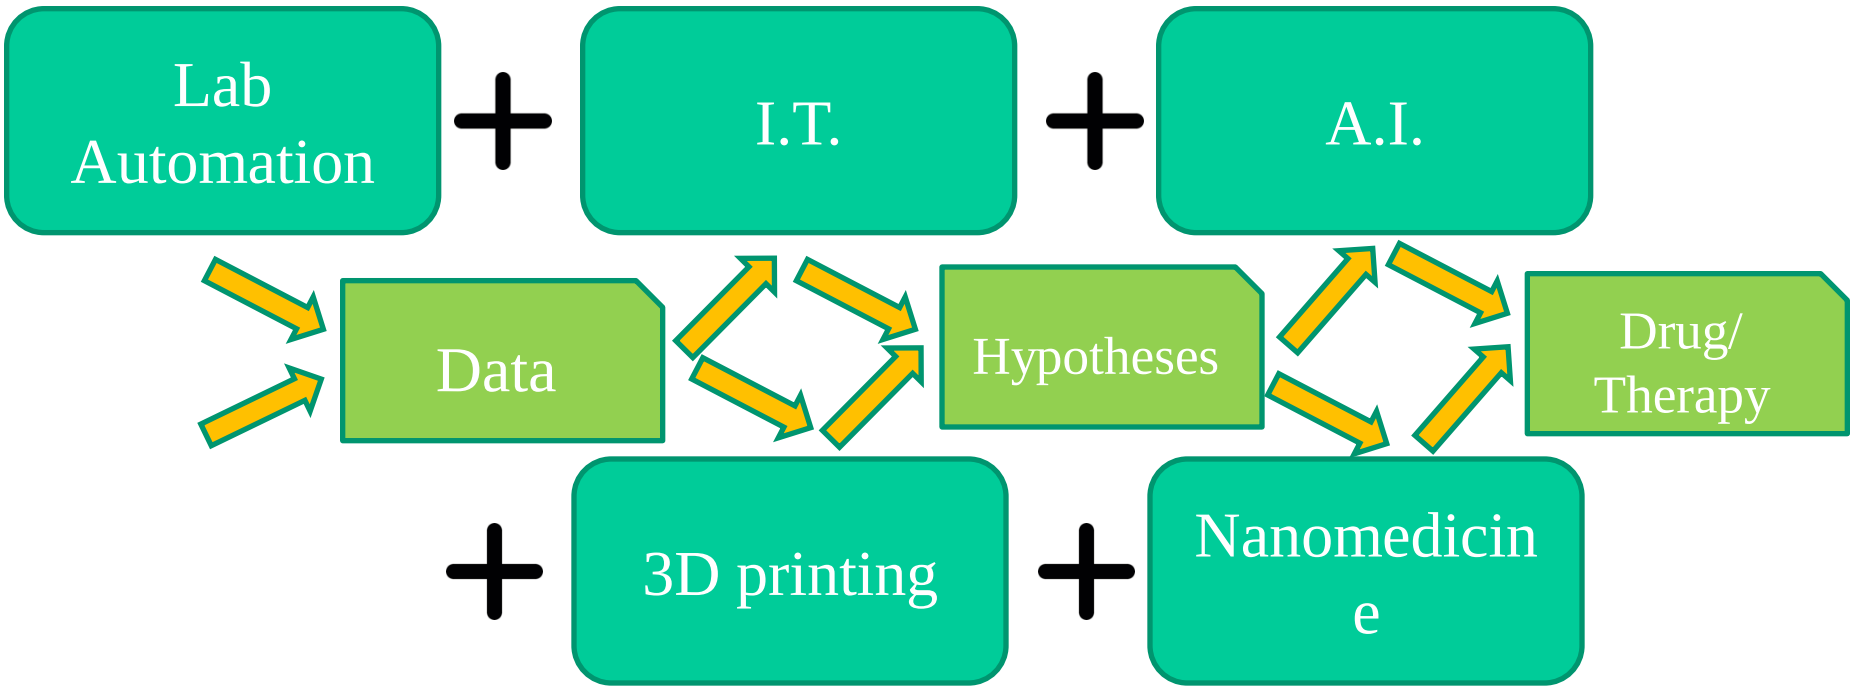
Drug Discovery

Automation and acceleration of drug discovery



Drug Discovery

And maybe even…



Drug Discovery

- Exscientia (Britain)
- Berg (Boston)
- Numerate (Bay Area)
- BenevolentAI (Britain)
- Atomwise (San Francisco)
- Insilico Medicine (Baltimor
- Desktop Genetics (B
- Sophia (Switzerland)
- PathAI (Boston)
- Recursion (Utah)
- Insitro (Bay Area)

Drug Discovery

- Exscientia (2012, Britain): rapid-prototyping platform that automates drug design via an expert system that is equipped with a repertory of best practices acquired from experts of the sector. This system can design millions of novel compounds and calculate for each how effective it is likely to be for a specific project. Then it can select the best ones for experiments.
- Collaborations with GSK, Sanofi and Evotec

Drug Discovery

- Atomwise (2012, San Francisco): neural network AtomNet to combine millions of molecular structures and infer the most likely to target a disease
- Working with IBM Watson
- Projects ranging from multiple sclerosis to ebola
- Collaborations with Merck

Merck is working with Atomwise to explore the frontiers of drug discovery using artificial intelligence and machine learning.

Drug Discovery

- Desktop Genetics

Drug Discovery

- Insilico Medicine (2014, Baltimore)
  - looks at drugs that are already safe to use and see if they can be re-purposed for other uses

Drug Discovery

- TwoXAR (Silicon Valley, 2014): identified a potential drug for liver cancer in just four months by screening 25,000 potential candidates in a joint project with Stanford (the only treatment approved by the FDA took five years to develop).

Drug Discovery

- Numerate (2007, Bay Area) can “virtually assay 25 million compounds from a library of 1 trillion compounds against a handful of accurate activity, selectivity and ADME models at a cost of one-one hundredth of a penny per compound, in about one week”

Drug Discovery

- Recursion (2013, Utah): computer vision to look at cells and analyze more than 1,000 features to determine whether a sick cell is being "cured" by the compounds that it massively produces.
- image-processing software developed by Anne Carpenter at the Broad Institute
- committed to discovering 100 disease treatments by 2025
- 2017: identified 15 potential treatments for rare diseases
- 2016: partnership with Sanofi

Drug Discovery

- BioAge Labs (2015, Berkeley): accelerate a the discovery of drugs for longevity

Drug Discovery

- PathAI (2016, Boston): end-to-end data-driven pathology analysis + clinical decision support tools
- Andrew Beck at Stanford built one of the earliest A.I. systems for cancer pathology
- Working with Philips to diagnose breast cancer

Andrew Beck
Aditya Khosla

PathAI

PHILIPS

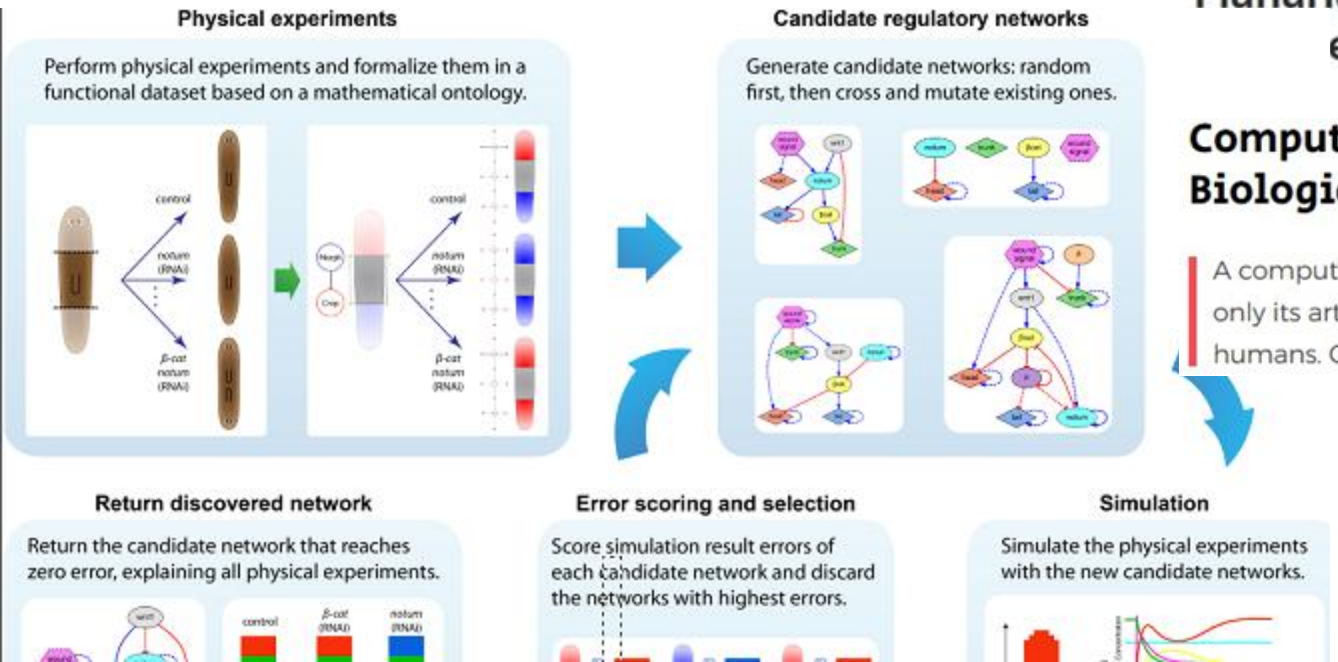
News center

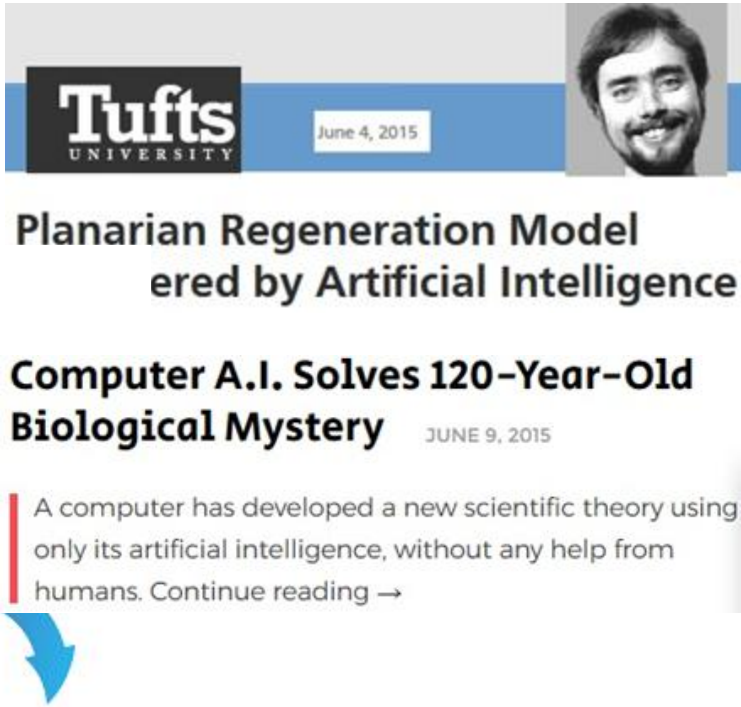
March 29, 2017

Philips and PathAI team up to improve breast cancer diagnosis using artificial intelligence technology in 'big data' pathology research

Drug Discovery

- 2015: Michael Levin's evolutionary algorithm reverse-engineers the regeneration mechanism of planaria (which had eluded human scientists for over 100 years)
- Planaria can regenerate its organs





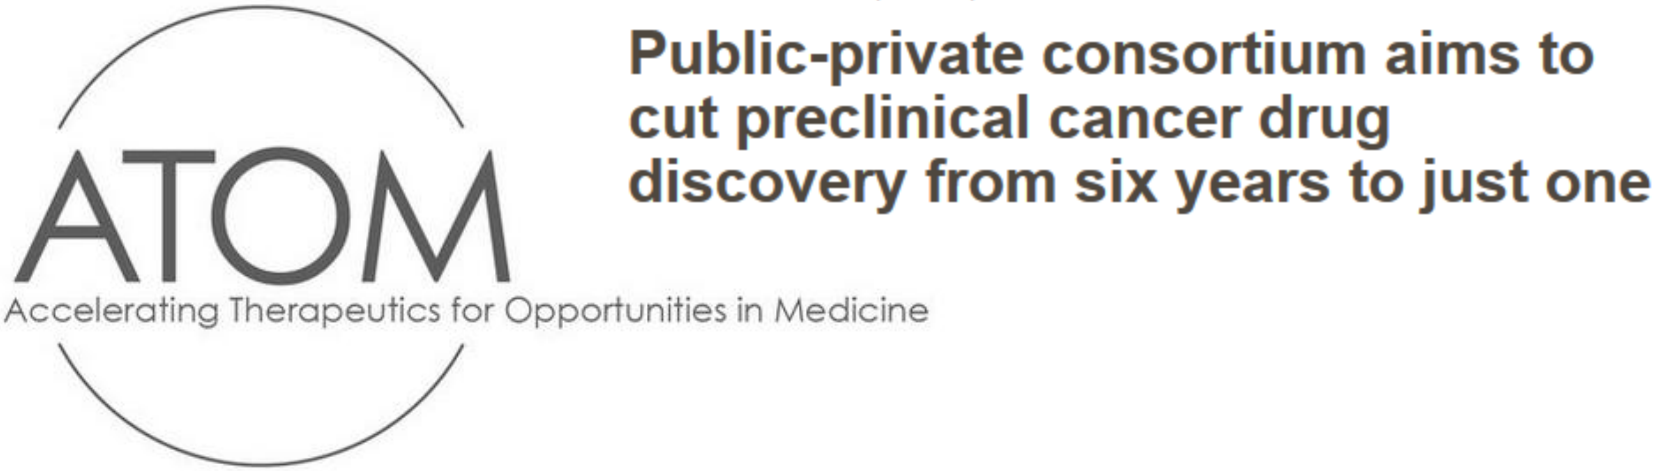
Drug Discovery

- 2016: IBM Watson discovers ALS genes
- It analyzed all published literature related to ALS and ranked genes based on the probability that they would be responsible for the proteins known to be associated with the disease: eight of the top ten genes are indeed associated with the disease, and five of them were previously not suspected.

Barrow Neurological Institute

Drug Discovery

- 2017: GlaxoSmithKline + Lawrence Livermore Lab + National Cancer Inst form ATOM consortium to transform drug discovery from the slow, sequential and failure-prone process that is today into a rapid and accurate process (from target to patient-ready in less than one year).



Drug Discovery

- 2017: First A.I. based system approved by FDA (a medical imaging platform by Arterys to detect heart problems)
- Not quite "biotech", but an important first step towards accepting A.I. as a "cure".

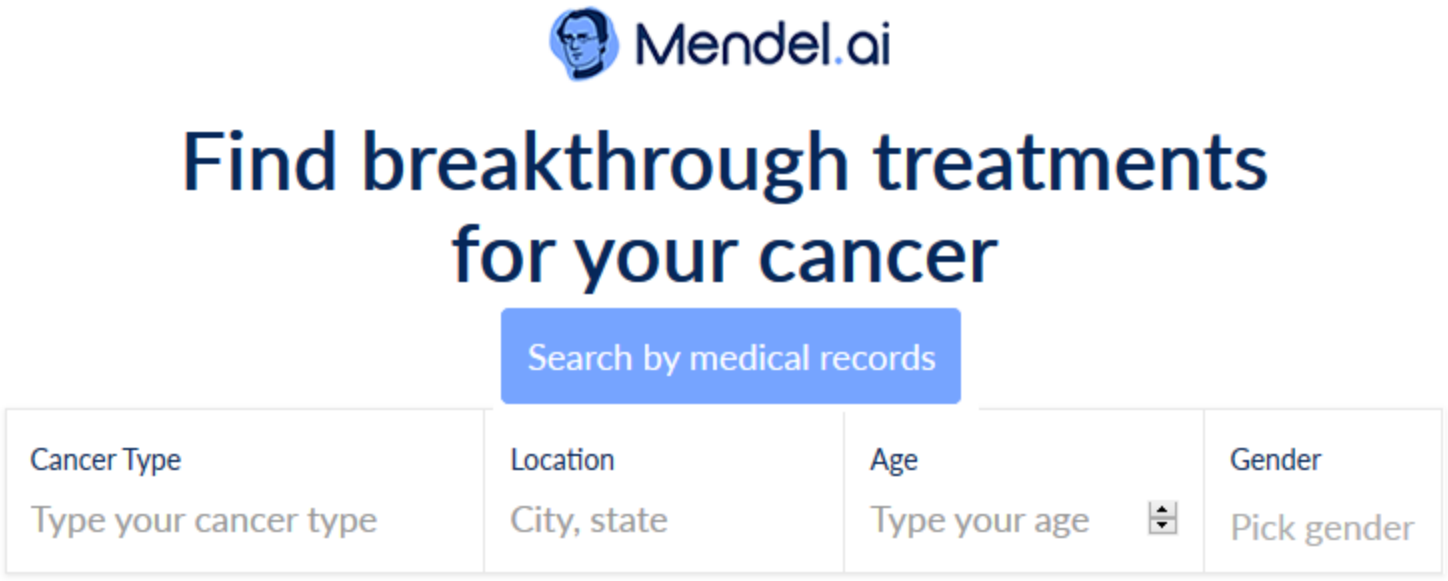
Towards Precision Medicine

A.I. could mark the end of the mass-produced drug

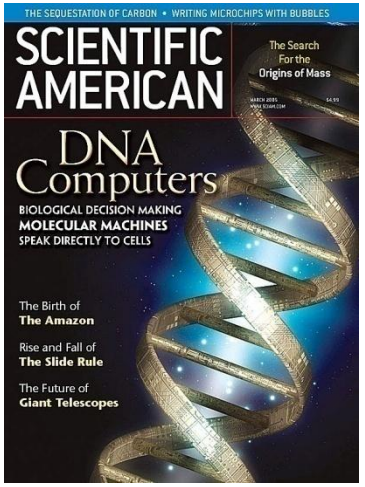
It could discover the specific drug that works best for your specific case

Towards Precision Medicine

- Mendel.ai (2016, San Francisco): provide customize treatments to cancer patients based on the latest published data (NLP tech to analyze medical publications and ANN to compare content with a patient's medical record)



DNA Computing



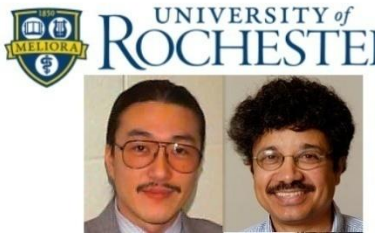
- DNA is a natural substance for computing
- You can encode a string of data in the sequence of nucleotides and use the properties of DNA to do the calculation.
- 1994: Leonard Adleman (Univ of Southern California) creates a DNA computer
- 1995: Richard Lipton (Princeton Univ): computational power of DNA (a DNA computer can break NSA's encryption)

USC University of Southern California

PRINCETON

DNA Computing

- 1999: Mitsunori Ogihara and Animesh Ray (Univ of Rochester): "Simulating Boolean Circuits on a DNA Computer"
- 1999: Ehud Shapiro (Israel): "A Blueprint for a Biomolecular Computer".
- 2002: First practical DNA computer (Akira Suyama)
- 2013: Drew Endy's biocomputer



DNA Computing

- Difference with electronic computers
  - Biocomputers are slow but…
  - Biocomputers can interact naturally with living systems
  - Biocomputers can be deployed in places where electronics cannot be deployed
  - Biocomputers can be deployed in the body and act like sentinels

DNA Origami

Expanding the Genetic Alphabet

- 2014: Floyd Romesberg at the Scripps Research Institute in San Diego expands life's genetic alphabet with two new bases in a living bacterium

SCRIPPS

Dangers

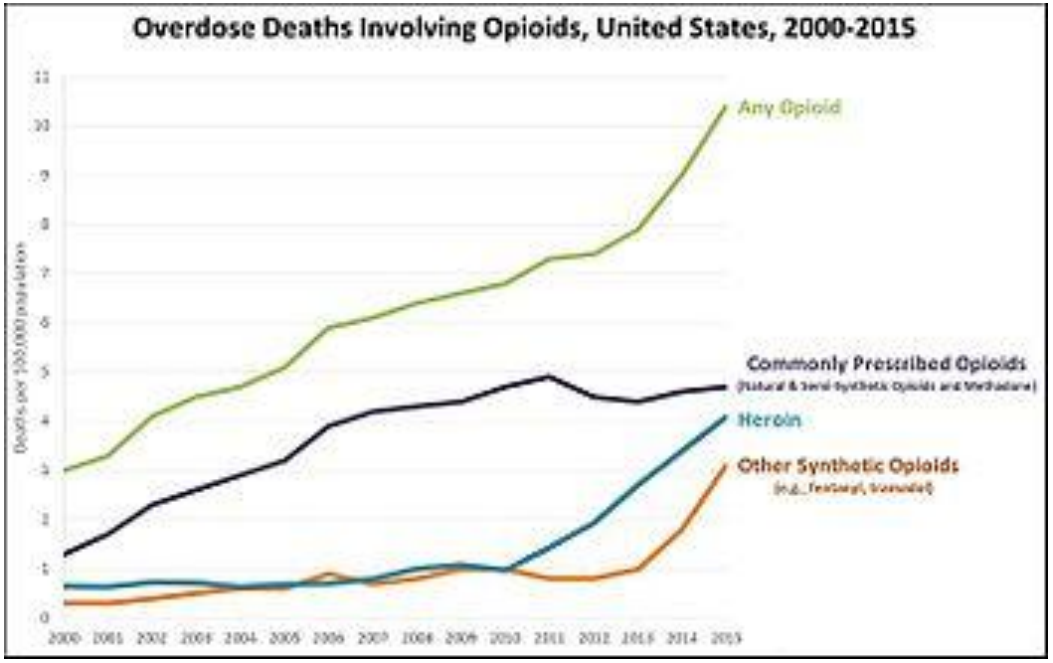
- The "undo" command doesn't exist in biotech. Biohackers may create something that will not be easily "undone".
- Who am i? Is it ok to change one of my genes or reprogram one of my cells? Am I still me? Would you like a brain transplant? Would you like a genome transplant?
- We still know very little about genomics. The human genome contains 25,000 genes, but rice contains 50,000. So a grain of rice is more complex than me?

Dangers

- I am not afraid of Biotech.
- I am afraid of
  - Pesticides
  - Infectious diseases (flue, malaria, ebola, AIDS, sika…)
  - Cancer
- Biotech can eliminate all of these.

Dangers

- Unfortunately we are also afraid of Big Pharma…



Dangers

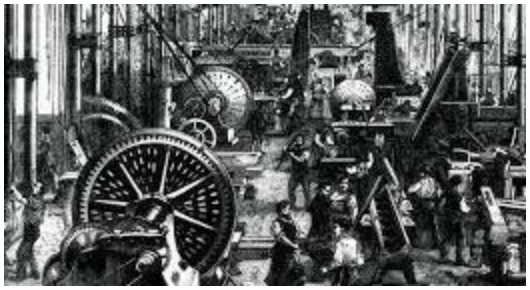
- The pharmaceutical industry is still stuck in the age of batch manufacturing
- All other industries moved on to continuous manufacturing (an integrated flow from raw materials to finished product)
- It can take one month to manufacture a drug that could be made in two days
- 2007: Novartis + MIT: Center for Continuous Manufacturing
- 2012 Continuous: spinoff of MIT + Novartis
- 2013 Glaxo in Singapore
- 2016: MIT prototype (portable drug making)

NOVARTIS

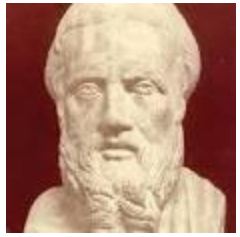
CONTINUS™ pharmaceuticals

Benefits

- We solved the problem of starvation with the agricultural revolution.
- We solved the problem of housing with the industrial revolution.



- There is still one big problem to solve that neither the agricultural nor the industrial revolutions solved: diseases.
- That requires the "biological revolution" that is going on today.
- Centuries from now the historians will write books about the biological revolution of the 21st century.



Longevity Economy

- The best birth control: education and wealth.
- Disruptive demographics: more and more old people, fewer and fewer young people
- By 2020: the population of people over 60 will control 30% of global spending, the equivalent of China's entire GDP ($9 trillion)
- Every business will be disrupted (retirement, real estate, tourism, smart cities, international affairs, ...)
- We don't have rituals, habits, sports, etc for old people.

Longevity Economy

- Longevity Science is multidisciplinary
- A new field that needs new thinking to seize an unprecedented opportunity
- What people want:
  - Longer lives
  - Better lives
- Longevity Technology must start from the day that the baby is born, planning the baby's behavior to maximize the chances of living as long as possible as healthy as possible

Longevity Economy

- Life will extend way beyond 65
- Society needs to keep "old" people active
- Today's children: no return on investment
- Society needs to keep "old" people productive
- Problems:
- 1. Today tech is developed by young people for young people
- 2. Old people neither invent nor adopt new technologies
- Who can develop tech for old people?

Longevity Economy

- Assisted Living Technology of the past
  - Hearing aids
  - Glasses
  - Microwave oven
  - Garage opener

Longevity Economy

- Prevention of Obesity
  - Semaglutide for weight loss
  - Micropeptide boosts physical fitness and prevents obesity
- Mitochondria tuneups
  - Elamipretide helps restore function to flagging mitochondria
- Supercentenarian Sequencing
  - Decoding the genomes of supercentenaria

Longevity Economy

Prevention of Alzheimer's Disease

- Devices stimulate the brain and prevent cognitive decline

mRNA Vaccines for Cancers

- Vaccines that exploit mRNA technology for several cancers

CRISPR-Based Cures

- Gene-editing tool to treat blood disorders, cancer, etc

Longevity Economy

Exercise-simulating Pills

- Drugs that mimic benefits of exercise

Artificial Young Blood

- Treatments that mimic the chemistry of young blood

Customized Microbiomes

- AI-controlled medications and diets to optimize the populations of microbes in our gut

Stopping the Epigenetic Clock

- Drugs that slow or reverse epigenetic clocks

Longevity Economy

Lab-Grown Organs

- Bladders cultivated in labs have already been implanted in humans

Pruning out aging Cells

- Drugs that kill or neutralize “senescent” cells

Anti-Aging Drugs

- Rapamycin stretches the lives of mice by more than a third
- Metformin (used by patients of Type 2 diabetes) may lower mortality for all
- Alpha-ketoglutarate extends life span in mice

Longevity Economy

Nanobots

- Nano-scale robots that travel inside the body and sense conditions and repair problems including cancers and deliver precisely targeted drugs

Cellular Reprogramming

- Gene-editing to rejuvenate organs

A Clinic in our Home

- Wearables, robotics and cloud computing to monitor people’s health without any need for doctor’s visits

Longevity Economy

- Can people over 80 innovate and create their own economy?
